# **Safety Instructions**

Explanation of Safety Instructions

### DANGER!

Indicates an immediate danger.

Death or serious injury may result if appropriate precautions are not taken.

### WARNING!

Indicates a possibly dangerous situation.

Death or serious injury may result if appropriate precautions are not taken.

### 

Indicates a situation where damage or injury could occur.

Minor injury or damage to property may result if appropriate precautions are not taken.

### NOTE!

Indicates the possibility of flawed results and damage to the equipment.

### General

The device has been manufactured using state-of-the-art technology and according to recognized safety standards. If used incorrectly or misused, however, it can cause

- Injury or death to the operator or a third party
- Damage to the device and other material assets belonging to the operating company
- Inefficient operation of the equipment

All persons involved in the commissioning, operation, maintenance, and servicing of the device must

- Be suitably qualified
- Have knowledge of welding
- Have completely read and followed these Operating Instructions

The Operating Instructions must always be at hand wherever the device is being used. In addition to the Operating Instructions, all applicable local rules and regulations regarding accident prevention and environmental protection must also be followed.

All safety and danger notices on the device must

- Be kept in a legible state
- Not be damaged/marked
- Not be removed
- Not be covered, pasted, or painted over

For the location of the safety and danger notices on the device, refer to the section headed "General" in the Operating Instructions for the device.

Before switching on the device, remove any faults that could compromise safety. Your personal safety is at stake!

Intended Use The device is to be used exclusively for its intended purpose.

	The device is intended exclusively for the welding process specified on the rating plate. Utilization for any other purpose, or in any other manner, shall be deemed to be "not in ac- cordance with the intended purpose." The manufacturer is not responsible for any damage resulting from improper use.
	<ul> <li>Proper use also means</li> <li>Completely reading and obeying all instructions in the Operating Instructions</li> <li>Completely reading and obeying all safety instructions and danger notices</li> <li>Carrying out all the specified inspection and servicing work</li> </ul>
	Never use the device for the following applications: - Thawing pipes - Charging batteries - Starting motors
	The device is designed for operation in industry and business. The manufacture shall not be liable for any damage resulting from use in a living area.
	The manufacture shall also not be liable for faulty or incorrect work results.
Environmental Conditions	Operation or storage of the device outside the stipulated area will be deemed as not in ac- cordance with the intended purpose. The manufacturer accepts no liability for any damage resulting from improper use.
	Temperature range of the ambient air: - During operation: -10°C to +40°C (14°F to 104°F) - During transport and storage: -20°C to +55°C (-4°F to 131°F)
	Relative humidity: - Up to 50% at 40°C (104°F) - Up to 90% at 20°C (68°F)
	Ambient air: free of dust, acids, corrosive gases or substances, etc. Altitude above sea level: up to 2000 m (6561 ft. 8.16 in.)
Obligations of the Operating Com- pany	<ul> <li>The operating company must only allow persons to work with the device if they</li> <li>Are familiar with the basic occupational safety and accident prevention regulations and are trained in handling the device</li> <li>Have read and understood these Operating Instructions, especially the section "Safety Rules," and have confirmed this with their signature</li> <li>Are trained according to the requirements for the work results</li> </ul>
	The safety-conscious work of the personnel must be checked regularly.
Obligations of Personnel	<ul> <li>All persons who are assigned to work with the device must do the following before beginning the work:</li> <li>Follow the basic regulations for occupational safety and accident prevention</li> <li>Read these Operating Instructions, especially the section "Safety Rules," and confirm that they have understood and will follow them by signing</li> </ul>
	Before leaving the workplace, ensure that no personal injury or property damage can occur in one's absence.
Grid Connection	Devices with a high output can influence the energy quality of the grid due to their current consumption.

This may affect a number of device types in terms of:

- connection restrictions
- criteria regarding maximum permissible grid impedance \*)
- criteria regarding the minimum required short-circuit power \*)

\*) both at the interface with the public grid See technical data

In this case, the operator or the person using the device should check whether or not the device is allowed to be connected, where appropriate through discussion with the power supply company.

**IMPORTANT!** Ensure secure grounding of the grid connection!

Personal Protec- tion and Protec- tion of Others	<ul> <li>You are exposed to numerous hazards while handling the device, for example:</li> <li>Flying sparks and pieces of hot metal</li> <li>Arc radiation that poses a risk of injury to the eyes and skin</li> <li>Hazardous electromagnetic fields that pose a risk of death for individuals with pacemakers</li> <li>Electrical risks from grid current and welding current</li> <li>Increased noise exposure</li> <li>Harmful welding fumes and gases</li> </ul>
	<ul> <li>Wear suitable protective clothing when dealing with the device. The protective clothing must have the following properties:</li> <li>Flame resistant</li> <li>Insulating and dry</li> <li>Covering the entire body and in good condition with no damage</li> <li>Safety helmet</li> <li>Cuffless pants</li> </ul>
	<ul> <li>Protective clothing involves the following:</li> <li>Protecting the face and eyes from UV radiation, heat and flying sparks with a face guard featuring a regulation-compliant filter</li> <li>Wearing regulation-compliant protective goggles with side protection behind the face guard</li> <li>Wearing rigid, wet-insulating footwear</li> <li>Protecting hands with appropriate gloves (featuring electrical insulation and thermal protection)</li> <li>Wearing ear protection to reduce noise exposure and protect against injury</li> </ul>
	<ul> <li>Keep persons, especially children, away during the operation of the devices and during the welding process. If persons are in the vicinity, however:</li> <li>Instruct them about all hazards (blinding hazard due to arcs, risk of injury from flying sparks, welding fumes hazardous to health, noise exposure, possible hazard due to grid current or welding current, etc.)</li> <li>Provide suitable protective equipment or</li> <li>Construct suitable protective walls and curtains.</li> </ul>
Danger from toxic gases and vapors	The fumes produced during welding contain toxic gases and vapors. Welding fumes contain substances that cause cancer, as stated in monograph 118 from
	the International Agency for Research on Cancer. Use at-source extraction source and a room extraction system. If possible, use a welding torch with an integrated extraction device.
	Keep your head out of the welding fumes and gases.

Take the following precautionary measures for fumes and harmful gases:

- Do not breathe them in.
- Extract them from the work area using appropriate equipment.

Ensure that there is a sufficient supply of fresh air. Ensure that there is a ventilation flow

	Ensure that there is a sufficient supply of fresh air. Ensure that there is a ventilation flow rate of at least 20 m³ per hour.
	Use a welding helmet with air supply if there is insufficient ventilation.
	If there is uncertainty as to whether the extraction capacity is sufficient, compare the mea- sured toxic emission values against the permissible limit values.
	<ul> <li>The following components are factors that determine how toxic the welding fumes are:</li> <li>The metals used for the workpiece</li> <li>Electrodes</li> <li>Coatings</li> <li>Cleaning agents, degreasers, and the like</li> <li>The welding process used</li> </ul>
	Consult the corresponding material safety data sheets and manufacturer's instructions for the components listed above.
	Recommendations for exposure scenarios, risk management measures and identifying working conditions can be found on the European Welding Association website under Health & Safety (https://european-welding.org).
	Keep flammable vapors (such as solvent vapors) out of the arc radiation range.
	When no welding is taking place, close the valve of the shielding gas cylinder or the main gas supply.
Danger from Fly- ing Sparks	Flying sparks can cause fires and explosions. Never undertake welding near flammable materials.
	Flammable materials must be kept at least 11 meters (36 ft. 1.07 in.) from the arc or pro- tected with a certified cover.
	Keep suitable, tested fire extinguishers on hand.
	Sparks and pieces of hot metal may also get into surrounding areas through small cracks and openings. Take appropriate measures to ensure that there is no risk of injury or fire.
	Do not undertake welding in areas at risk of fire and explosion, or on sealed tanks, drums, or pipes if these have not been prepared in accordance with corresponding national and international standards.
	Do not undertake welding on containers in which gases, fuels, mineral oils, and the like are/ were stored. Residues pose a risk of explosion.
Risks from grid	An electric shock can be fatal.
current and weld- ing current	Do not touch voltage-carrying parts inside or outside the device.
	During MIG/MAG welding and TIG welding, the welding wire, the wirespool, the feed roll- ers, as well as all pieces of metal that are in contact with the welding wire, are live.

Always place the wirefeeder on a sufficiently insulated base or use a suitable insulating wirefeeder holder.

Ensure suitable personal protection with dry temporary backing or cover with sufficient insulation against the ground potential. The temporary backing or cover must completely cover the entire area between the body and the ground potential.

All cables and leads must be secured, undamaged, insulated, and adequately dimensioned. Replace loose connections and scorched, damaged, or inadequately dimensioned cables and leads immediately.

Before every use, check power connections for secure fit by hand.

In the case of power cables with bayonet connectors, turn the power cable by at least 180° around the longitudinal axis and pretension.

Do not wrap cables or leads around your body or parts of the body.

Concerning the electrode (rod electrode, tungsten electrode, welding wire, etc.)

- Never immerse it in liquids to cool it
- Never touch it when the power source is switched on.

The open circuit voltage of a welding system may double, for example, between the electrodes of two welding systems. Touching the potentials of both electrodes at the same time may be life-threatening in some cases.

Have the grid and device supply lead regularly inspected by an electrician to ensure that the ground conductor is functioning properly.

Protection class I devices require a grid with a ground conductor and a connector system with ground conductor contact for proper operation.

Operation of the device on a grid without a ground conductor and on a socket without a ground conductor contact is only permitted if all national regulations for protective separation are observed.

Otherwise, this is considered gross negligence. The manufacturer accepts no liability for any damage resulting from improper use.

Use suitable equipment to ensure that the workpiece is sufficiently grounded if necessary.

Switch off unused devices.

When working at elevated heights, wear a safety harness to prevent falls.

Before working on the device, switch off the device and remove the grid plug.

Secure the device to prevent the grid plug from being connected and switched on again by applying a clearly legible and understandable warning sign.

After opening the device:

- Discharge all electrically charged components
- Ensure that all components are disconnected from the power supply.

If work is needed on voltage-carrying parts, bring in a second person who will switch off the main switch at the correct time.

**Stray welding** If the following instructions are not observed, stray welding currents may occur, which pose a risk of the following:

- Fire
- Overheating of components connected to the workpiece
- Destruction of ground conductors
- Damage to the device and other electrical equipment

Ensure that the workpiece terminal is securely connected to the workpiece.

Secure the workpiece terminal as close to the spot to be welded as possible.

	Position the device with sufficient insulation against electrically conductive environments, e.g., insulation against electrically conductive floors or electrically conductive mounts.
	Observe the following when using electrical distributors, double-headed retainers, etc.: Even the electrode of the welding torch/electrode holder not in use carries electric poten- tial. Ensure that there is sufficient insulation when the unused welding torch/electrode hold- er is stored.
	In automated MIG/MAG applications, only guide the wire electrode from the welding wire drum, large spool or wirespool to the wirefeeder with insulation.
EMC Device Clas- sifications	Devices in emission class A: - Are only designed for use in industrial settings - Can cause line-bound and radiated interference in other areas
	<ul> <li>Devices in emission class B:</li> <li>Satisfy the emissions criteria for residential and industrial areas. This is also true for residential areas in which the energy is supplied from the public low-voltage grid.</li> </ul>
	EMC device classification as per the rating plate or technical data.
EMC Measures	In certain cases, even though a device complies with the standard limit values for emis- sions, it may affect the application area for which it was designed (e.g., when there is sen- sitive equipment at the same location, or if the site where the device is installed is close to either radio or television receivers). If this is the case, then the operating company is obliged to take appropriate action to rectify the situation.
	<ul> <li>Test and assess the immunity of equipment in the vicinity of the device in accordance with national and international provisions. Examples of interference-prone equipment that could be affected by the device:</li> <li>Safety devices</li> <li>Grid power lines, signal lines and data transfer lines</li> <li>EMC and telecommunications equipment</li> <li>Devices for measuring and calibrating</li> </ul>
	<ul> <li>Supporting measures to avoid EMC problems:</li> <li>1. Grid power supply <ul> <li>If electromagnetic interference occurs despite a grid connection that complies with regulations, take additional measures (e.g., use a suitable grid filter).</li> </ul> </li> <li>2. Welding power-leads <ul> <li>Keep them as short as possible</li> <li>Route them close together (also to avoid EMF problems)</li> <li>Route them far from other lines</li> </ul> </li> <li>3. Equipotential bonding <ul> <li>Workpiece grounding</li> <li>If necessary, establish grounding using suitable capacitors</li> </ul> </li> <li>5. Shield, if necessary <ul> <li>Shield other devices in the vicinity</li> <li>Shield the entire welding installation</li> </ul> </li> </ul>

### EMF measures

Electromagnetic fields may cause health problems that are not yet known:

- Effects on the health of persons close by, e.g., those with pacemakers and hearing aids
- Persons with pacemakers must seek advice from their doctor before staying in the immediate vicinity of the device and the welding process
- Keep distances between welding cables and the head/torso of the welder as large as possible for safety reasons
- Do not carry welding cables and hosepacks over one's shoulder or wrap them around one's body or body parts

Particular Hazard	Keep hands, hair, loose clothing, and tools away from moving parts, such as:
Areas	- fans
	- gears

- rollers
- shafts
- wirespools and welding wires.

Do not reach into rotating gears of the wire drive or into rotating drive parts.

Covers and side parts must only be opened/removed during maintenance and repair work.

During operation:

- Ensure that all covers are closed, and all side parts have been mounted properly.
- Keep all covers and side parts closed.

The protrusion of welding wire from the welding torch represents a high risk of injury (cuts to the hand, facial and eye injuries, etc.)

Therefore always hold the welding torch away from the body (devices with wirefeeder) and use suitable protective goggles.

Do not touch the workpiece during or after welding—burning hazard.

Slag may fly off cooling workpieces. Therefore, also wear regulation-compliant protective equipment when reworking workpieces and ensure that other persons are sufficiently protected.

Leave the welding torch and other parts with a high operating temperature to cool before working on them.

Special regulations apply in areas at risk of fire or explosion – follow the appropriate national and international regulations.

Power sources for work in areas with increased electrical hazard (e.g. boilers) must be labeled with the symbol (Safety). However, the power source may not be located in such areas.

Risk of scalding due to leaking coolant. Switch off the cooling unit before disconnecting connections for the coolant supply or return.

When handling coolant, observe the information on the coolant safety data sheet. The coolant safety data sheet can be obtained from your service center or via the manufacturer's website.

Only use suitable load-carrying equipment from the manufacturer when transporting devices by crane.

- Attach chains or ropes to all designated attachments of the suitable load-carrying equipment.
- Chains or ropes must be the smallest angle possible from vertical.
- Remove gas cylinder and wirefeeder (MIG/MAG and TIG devices).

	In the event of crane attachment of the wirefeeder during welding, always use a suitable, insulating wirefeeder hoisting attachment (MIG/MAG and TIG devices).
	If the device is equipped with a carrier belt or handle, then this is used exclusively for trans- port by hand. The carrier belt is not suitable for transport by crane, counterbalanced lift truck or other mechanical lifting tools.
	All lifting equipment (belts, buckles, chains, etc.), which is used in association with the de- vice or its components, must be checked regularly (e.g. for mechanical damage, corrosion, or changes due to other environmental influences). The test interval and scope must at least comply with the respective valid national stan- dards and guidelines.
	There is a risk of colorless, odorless shielding gas escaping without notice if an adapter is used for the shielding gas connection. Use suitable Teflon tape to seal the thread of the shielding gas connection adapter on the device side before installation.
Requirement for the shielding gas	Especially with ring lines, contaminated shielding gas can cause damage to equipment and reduce welding quality. Meet the following requirements regarding shielding gas quality: - Solid particle size < 40 μm - Pressure condensation point < -20 °C - Max. oil content < 25 mg/m <sup>3</sup>
	Use filters if necessary.
Danger from Shielding Gas Cylinders	Shielding gas cylinders contain compressed gas and may explode if damaged. Shielding gas cylinders are an integral part of the welding equipment, so they must be handled very carefully.
	Protect shielding gas cylinders with compressed gas from excessive heat, mechanical im- pact, slag, open flames, sparks, and arcs.
	Mount the shielding gas cylinders vertically and secure them in accordance with instruc- tions so they cannot fall over.
	Keep shielding gas cylinders away from welding or other electrical circuits.
	Never hang a welding torch on a shielding gas cylinder.
	Never touch a shielding gas cylinder with an electrode.
	Risk of explosion: Never weld on a compressed shielding gas cylinder.
	Always use suitable shielding gas cylinders for the application in question and the correct matching accessories (controller, hoses, and fittings, etc.) Only use shielding gas cylinders and accessories that are in good condition.
	If a valve on a shielding gas cylinder is open, turn your face away from the outlet.
	When no welding is taking place, close the valve of the shielding gas cylinder.
	Leave the cap on the valve of the shielding gas cylinder when the cylinder is not connected.
	Follow the manufacturer's instructions and applicable national and international provisions

Danger Posed by Shielding Gas Leak

Risk of asphyxiation due to uncontrolled shielding gas leak

	<ul> <li>Shielding gas is colorless and odorless and may suppress the oxygen in the ambient air in the event of leakage.</li> <li>Ensure there is a sufficient supply of fresh air with a ventilation flow rate of at least 20 m<sup>3</sup> per hour.</li> <li>Please observe the safety and maintenance information for the shielding gas cylinder or the main gas supply.</li> <li>When no welding is taking place, close the valve of the shielding gas cylinder or the main gas supply.</li> <li>Always check the shielding gas cylinder or main gas supply for uncontrolled gas leakage before each start-up.</li> </ul>
Safety Measures at the Setup Loca-	A toppling device can be deadly! Set up the device securely on an even, solid surface - The maximum permitted tilt angle is 10°.
tion and During Transport	Special regulations apply in areas at risk of fire or explosion - Follow the appropriate national and international regulations.
	Use instructions and checks within the company to ensure that the vicinity of the workplace is always clean and organized.
	Only set up and operate the device in accordance with the protection class shown on the rating plate.
	When setting up the device, ensure that there is an all-round clearance of 0.5 m (1 ft. 7.69 in.) to allow cooling air to circulate unhindered.
	Take care to ensure that the applicable national and regional guidelines and accident pre- vention regulations are observed when transporting the device, especially guidelines con- cerning hazards during transport and shipment.
	Do not lift or transport any active devices. Switch off devices before transport or lifting.
	Before transporting the device, completely drain the coolant and dismantle the following components: - wirefeeder - wirespool - shielding gas cylinder
	It is essential to conduct a visual inspection of the device to check for damage after it has been transported but before commissioning. Have any damage repaired by trained service technicians before commissioning the device.
Safety Measures in Normal Opera- tion	<ul> <li>Only operate the device when all safety devices are fully functional. If the safety devices are not fully functional, there is a danger of:</li> <li>Injury or death to the operator or a third party</li> <li>Damage to the device and other material assets belonging to the operating company</li> <li>Inefficient operation of the device</li> </ul>
	Safety devices that are not fully functional must be repaired before the device is switched on.
	Never bypass or disable safety devices.
	Before switching on the device, ensure that no one can be put in danger.
	The device must be examined at least once a week for externally detectable damage and functionality of the safety devices.
	Always secure the shielding gas cylinder well and remove before transporting by crane.

	Only the original coolant from the manufacturer is suitable for use in our devices due to its properties (electrical conductivity, anti-freeze, material compatibility, flammability, etc.)
	Only use appropriate original coolant from the manufacturer.
	Do not mix original coolant from the manufacturer with other coolants.
	Only connect system components from the manufacturer to the cooling unit circuit.
	If there is damage due to use of other system components or other coolants, the manufac- turer accepts no liability for this and all warranty claims are forfeited.
	Cooling Liquid FCL 10/20 is not flammable. The ethanol-based coolant is flammable in cer- tain conditions. Only transport the coolant in closed original containers and keep away from sources of ignition.
	Properly dispose of used coolant according to national and international regulations. The coolant safety data sheet can be obtained from your service center or via the manufactur- er's website.
	When the system is cool, always check the coolant level before starting welding.
Maintenance and repair	<ul> <li>It is impossible to guarantee that bought-in parts are designed and manufactured to meet the demands made of them, or that they satisfy safety requirements.</li> <li>Use only original spare and wearing parts (also applies to standard parts).</li> <li>Do not carry out any modifications, alterations, etc. to the device without the manufacturer's consent.</li> <li>Components that are not in perfect condition must be replaced immediately.</li> <li>When ordering, please give the exact designation and part number as shown in the spare parts list, as well as the serial number of your device.</li> </ul>
	The housing screws provide the ground conductor connection for earthing the housing parts. Only use original housing screws in the correct number and tightened to the specified torque.
Safety Inspection	The manufacturer recommends that a safety inspection of the device be performed at least every 12 months.
	The manufacturer recommends calibrating power sources within the same 12-month inter- val.
	<ul> <li>A safety inspection by a certified electrician is recommended:</li> <li>After changes</li> <li>After alterations</li> <li>After repair, care, and maintenance</li> <li>At least every 12 months</li> </ul>
	For the safety inspection, follow the appropriate national and international standards and guidelines.
	You can obtain more information about the safety inspection and calibration from your ser- vice center. The service center will provide the necessary documents upon request.
Disposal	Do not dispose of this device with normal domestic waste! To comply with the European Directive on Waste Electrical and Electronic Equipment and its implementation as national law, electrical equipment that has reached the end of its life must be collected separately and returned to an approved recycling facility. Any device that you no longer require must

	be returned to your dealer, or you must locate the approved collection and recycling facil- ities in your area. Ignoring this European Directive may have potentially adverse affects on the environment and your health!
Safety Symbols	Devices with the CE label satisfy the essential requirements of the low-voltage and elec- tromagnetic compatibility directive (e.g. relevant product standards of the EN 60974 se- ries).
	Fronius International GmbH declares that the device complies with Directive 2014/53/EU. The full text of the EU Declaration of Conformity is available on the following website: http://www.fronius.com
	Devices marked with the CSA test mark satisfy the requirements of the relevant standards for Canada and the USA.
Data backup	The user is responsible for backing up any changes made to the factory settings. The man- ufacturer accepts no liability for any deleted personal settings.
Copyright	Copyright of these Operating Instructions remains with the manufacturer.
	Text and illustrations were accurate at the time of printing. Fronius reserves the right to make changes. The contents of the Operating Instructions shall not provide the basis for any claims whatsoever on the part of the purchaser. If you have any suggestions for improvement, or can point out any mistakes that you have found in the Operating Instructions, we will be most grateful for your comments.

**General information** 

### **Device concept**

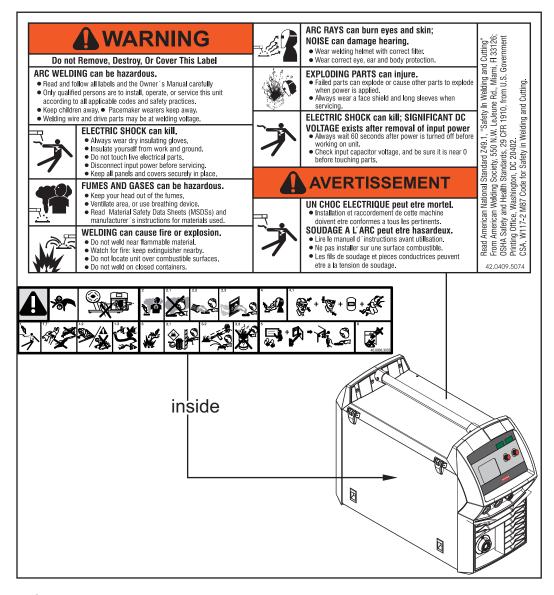

The TransSteel (TSt) 3000c Pulse power source is a fully digitized, microprocessorcontrolled inverter power source.

A modular design and ability to easily extend the system guarantee a high degree of flexibility. The device is designed for the following welding processes:

- MIG/MAG pulse welding -
- MIG/MAG standard synergic welding --
- TIG welding
- -Manual metal arc welding

The device has a "Power limitation" safety feature. This means that the power source can be operated at the power limit without compromising process safety. For details, refer to the "Welding operations" chapter.

Operating principle	<ul> <li>The central control and regulation unit of the power sources is coupled with a digital signal processor. The central control and regulation unit and signal processor control the entire welding process.</li> <li>During the welding process, the actual data is measured continuously and the device responds immediately to any changes. Control algorithms ensure that the desired target state is maintained.</li> <li>This results in: <ul> <li>A precise welding process</li> <li>A high degree of reproducibility on all results</li> <li>Excellent weld properties.</li> </ul> </li> </ul>
Application areas	<ul> <li>The TransSteel 3000c Pulse is used in trade and industry for manual applications with classical steel and galvanized sheet metal.</li> <li>The power source is designed for: <ul> <li>Mechanical and equipment engineering</li> <li>Steel construction</li> <li>Plant and container construction</li> <li>Metal and portal construction</li> <li>Rail vehicle construction</li> <li>Metalworking trades</li> </ul> </li> </ul>
Warning notices on the device	There are warning notices and safety symbols on the power sources. These warning no- tices and safety symbols must not be removed or painted over. They warn against incorrect operation, as this may result in serious injury and property damage.

Welding is dangerous. The following basic requirements must be met:

- Adequate welding qualifications
- Appropriate protective equipment
- Exclusion of unauthorized persons

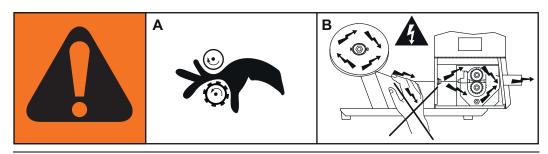

Do not use the functions described here until you have fully read and understood the following documents:

- These Operating Instructions
- All system component Operating Instructions, especially the safety rules

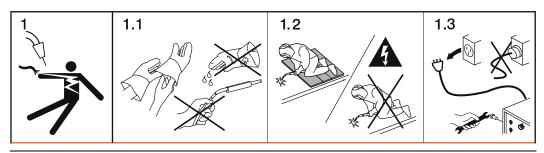

### Description of Warning Notices on the Device

On certain device versions, warning notices are attached to the device.

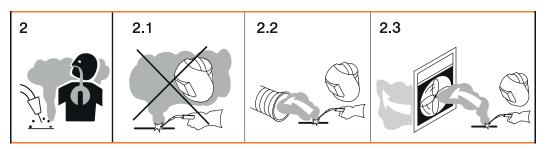

The arrangement of the symbols may vary.

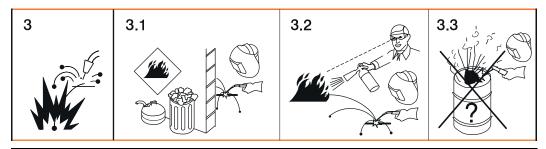

- Warning! Watch Out! There are possible hazards as shown by the symbols.
- A Drive rolls can injure fingers.
- B Welding wire and drive parts are at welding voltage during operation Keep hands and metal objects away.

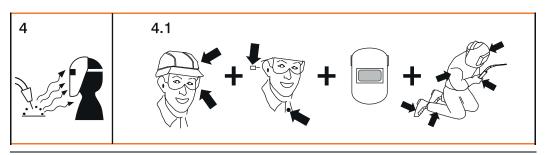

- 1. Electric shock can kill.
- 1.1 Wear dry insulating gloves. Do not touch electrode with bare hand. Do not wear wet or damaged gloves.
- 1.2 Protect yourself from electric shock by insulating yourself from work and ground.
- 1.3 Disconnect input plug or power before working on machine

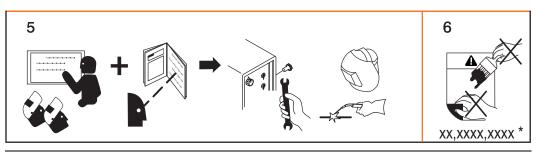

- 2. Breathing welding fumes can be hazardous to your health.
- 2.1 Keep your head out of the fumes.
- 2.2 Use forced ventilation or local exhaust to remove the fumes.
- 2.3 Use ventilating fan to remove fumes.

- 3 Welding sparks can cause explosion or fire.
- 3.1 Keep flammables away from welding. Don't weld near flammables.
- 3.2 Welding sparks can cause fires. Have a fire extinguisher nearby and have a watchperson ready to use it.
- 3.3 Do not weld on drums or any closed containers.

- 4. Arc rays can burn eyes and injure skin.
- 4.1 Wear hat and safety glasses. Use ear protection and button shirt collar. Use welding helmet with correct shade of filter. Wear complete body protection.

- 5. Become trained and read the instructions before working on the machine or welding.
- 6. Do not remove or paint over (cover) the label.
- \* identifying number to order label from manufacturer

# Welding processes, procedures, and welding characteristics for MIG/MAG welding

General	In order to process a wide range of materials effectively, various welding processes, pro- cedures, and welding characteristics are available on the power source.
Brief description	MIG/MAG standard synergic
of MIG/MAG stan-	MIG/MAG standard synergic welding is a MIG/MAG welding process covering the entire
dard synergic	power range of the power source with the following arc types:
welding	Dip transfer arc
	Droplet transfer occurs in the lower power range during the short circuit. Intermediate arc The droplet increases in size at the end of the wire electrode and is transferred in the mid power range during the short circuit. Spray arc A short circuit-free transfer of material in the high power range.
Brief description	MIG/MAG pulsed synergic
of MIG/MAG	MIG/MAG pulsed synergic welding is a pulsed arc process with a controlled material trans-
pulsed synergic	fer.
welding	In the base current phase, the energy input is reduced to such an extent that the arc barely
	burns steadily and the surface of the workpiece is preheated. In the pulsing current phase, an accurately timed current pulse guarantees a precise detachment of the weld material droplet. This principle guarantees low-spatter welding and precise operation throughout the entire power range.
Brief description	SynchroPulse is available for the standard synergic and pulsed synergic processes.
of SynchroPulse	The cyclic change of the welding power between two operating points with SynchroPulse
welding	achieves a finely rippled weld appearance and a non-continuous heat input.

# System components

#### General

The power sources can be operated with various system components and options. This makes it possible to optimize procedures and to simplify machine handling and operation, depending on the field of application for the power source.

### Safety

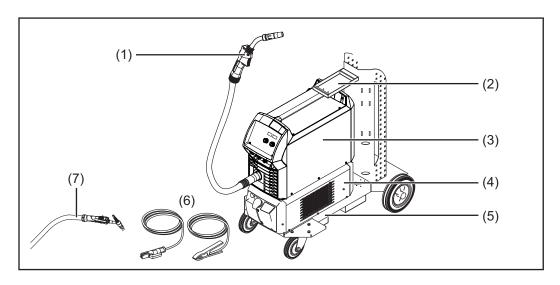

### WARNING!

### Danger due to incorrect operation.

This can result in severe personal injury and damage to property.

- Do not use the functions described here until you have fully read and understood the Operating Instructions.
- Do not use the functions described here until you have fully read and understood all of the Operating Instructions of the system components, especially the safety rules.

#### **Overview**

- (1) MIG/MAG welding torch
- (2) Stabilization of the gas cylinder holder
- (3) Power source
- (4) Cooling unit
- (5) Trolley with gas cylinder holder
- (6) Grounding and electrode cable
- (7) TIG welding torch

# **Operating controls and connections**

## **Control Panel**

General

The functions are all arranged in a logical way on the control panel. The individual parameters required for welding can be

- Selected by means of buttons
- Changed using buttons or the selection dial
- Shown on the digital display during welding.

Due to the synergic function, all other parameters are also adjusted if a single parameter is changed.

### NOTE!

Because of software updates, certain functions may be available for your device but not described in these Operating Instructions or vice versa.

In addition, individual figures may also differ slightly from the operating elements of your device. However, the function of these operating elements is identical.

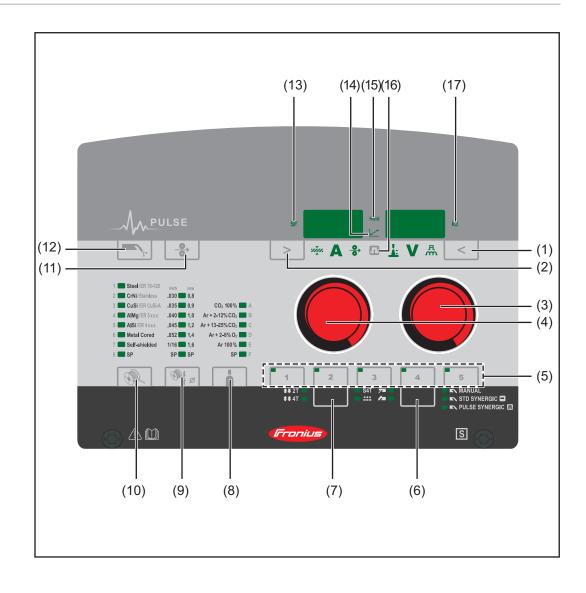

### Safety

### WARNING!

Danger from incorrect operation and work that is not carried out properly.

- Serious personal injury and damage to property may result.
- Read and understand this document.
- Read and understand all the Operating Instructions for the system components, especially the safety rules.

### **Control panel**

No.	Function
(1)	"Parameter selection" button (right)
	a) for selecting the following parameters
	Arc length correction
	For correcting the arc length
	V
	Welding voltage in V *)

Before welding begins, the device automatically displays a standard value based on the programmed parameters. The actual value is displayed during welding.

# A

### Pulse / arc-force dynamic correction

For continuously correcting the droplet detachment force in MIG/MAG pulsed synergic welding

- ... reduced droplet detachment force
- 0 ... neutral droplet detachment force
- + ... increased droplet detachment force

For influencing the short-circuiting dynamic at the instant of droplet transfer in MIG/ MAG standard synergic welding, MIG/MAG standard manual welding, and manual metal arc welding

- ... harder and more stable arc
- 0 ... neutral arc
- + ... soft and low-spatter arc
- b) for changing parameters in the Setup menu
- (2) "Parameter selection" button (left)a) for selecting the following parameters

### Sheet thickness

Sheet thickness in mm or in.

If the welding current to be selected is not known, it is sufficient to enter the sheet thickness. The required welding current and any other parameters marked with \*) will then be adjusted automatically.

### Welding current \*)

Welding current in A

Before welding begins, the device automatically displays a standard value based on the programmed parameters. The actual value is displayed during welding.

### **Wire speed** \*) Wire speed in m/min or ipm.

b) for changing parameters in the Setup menu

### (3) Selection dial (right)

For changing the arc length correction, welding voltage, and arc-force dynamic parameters

Special 4-step mode

•••

Spot welding/stitch welding

#### (8) "Shielding gas" button

For selecting the shielding gas used. The SP parameter is reserved for additional shielding gases.

When the shielding gas is selected, the LED behind the corresponding shielding gas lights up.

#### (9) "Wire diameter" button

For selecting the wire diameter used. The SP parameter is reserved for additional wire diameters.

When the wire diameter is selected, the LED behind the corresponding wire diameter lights up.

#### "Material" button (10)

For selecting the filler metal used. The SP parameter is reserved for additional materials.

When the material type is selected, the LED behind the corresponding filler metal lights up.

(11)	"Wire threading" button
	Press and hold the button:
	Gasless wire threading into the torch hosepack
	While the button is being held, the wire drive operates at feeder inching speed.
(12)	Gas-test button
	For setting the required gas volume on the gas pressure regulator.
	Tap the button once: shielding gas flows out
	Tap the button again: shielding gas flow stops
	If the Gas-test button is not tapped again, the shielding gas flow will stop after 30 s.
(13)	SF - spot/stitch/SynchroPulse welding indicator
-	Lights up if a value is set for the spot welding/stitch welding time (SPt) setup pa-
-	rameter when spot welding or stitch welding mode is activated Lights up if a value is set for the Frequency (F) setup parameter when the MIG/
	MAG synergic welding process is activated.
(14)	Intermediate arc indicator
	A spatter-prone "intermediate arc" occurs between the dip transfer arc and the
	spray arc. The intermediate arc indicator lights up to alert you to this critical area.
(15)	HOLD indicator
	At the end of each welding operation, the actual values for welding current and welding voltage are stored - the "HOLD" indicator lights up.
(16)	Pulse indicator
	Lights up when the MIG/MAG pulsed synergic welding process is selected
(17)	Real Energy Input
	For displaying the energy applied during the welding operation.
	The Real Energy Input indicator must be activated in level 2 of the Setup menu –
	EnE parameter. The value continuously rises during welding in line with the perma-
	nently increasing energy input. The final value is stored after the end of welding un-
	til welding starts again or the power source is switched back on - the HOLD indicator lights up.
*)	During the MIG/MAG standard synergic welding process and MIG/MAG pulsed
,	synergic welding process, if one of these parameters is selected, then the synergic
	function ensures that all other parameters, including the welding voltage parame-
	ter, are adjusted automatically.
**)	In conjunction with the VRD option, the indicator of the currently selected welding
-	process is also used as status indicator:
	The indicator lights up continuously: the voltage reduction (VRD) is active and lim- its the output voltage to less than 35 V.
-	The indicator flashes as soon as a welding operation occurs, which can cause the
	output voltage to be greater than 35 V.

**Service parame-** Various service parameters can be retrieved by pressing the "Parameter selection" buttons at the same time.

#### Opening the display

The first parameter "Firmware version" will be displayed, e.g., "1.00 | 4.21"

### **Selecting parameters**

Use the "Mode" and "Process" buttons or the left-hand selection dial to select the desired setup parameter

#### Available parameters

> 🦗 A 🛠 🛓 V 🗛 <	Explanation
Example: 1.00   4.21	Firmware version
Example: 2   491	Welding program configuration
Example: r 2   290	Number of the currently selected welding program
Example: 654   32.1 = 65,432.1 hours = 65,432 hours 6 mins	Indicates the actual arc time since first use Note: The arc time indicator is not suitable as a basis for calculating hiring fees or for warranty purposes, etc.
Example: iFd  0.0	Motor current for wire drive in A The value changes as soon as the motor is running.
2nd	Second menu level for service technicians

### Keylock

A keylock can be selected to prevent the settings from being inadvertently changed on the control panel. As long as the keylock is active:

- Settings cannot be adjusted on the control panel
- Only parameter settings can be retrieved
- Any assigned "Save" button can be retrieved provided that an assigned "Save" button was selected when the keylock was enabled

Activate/deactivate the keylock as follows:

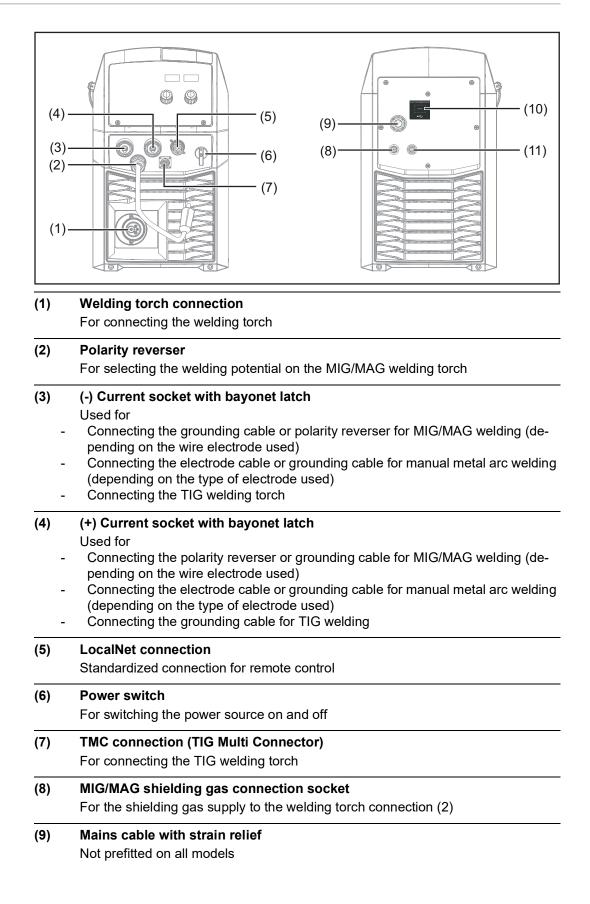

Keylock activated: The message "CLO | SEd" appears on the displays.

Keylock deactivated: The message "OP | En" appears on the displays.

The keylock can also be activated and deactivated using the keylock switch option.

# **Installation and Startup**

## Minimum equipment for welding operations

General	Depending on the welding process, a minimum level of equipment is required to work with the power source. The following describes the welding processes and the corresponding minimum equip- ment for welding operations.
Gas-cooled MIG/ MAG welding	<ul> <li>Power source</li> <li>Grounding cable</li> <li>Gas-cooled MIG/MAG welding torch</li> <li>Gas connection (shielding gas supply)</li> <li>Wire electrode</li> </ul>
Water-cooled MIG/MAG welding	<ul> <li>Power source</li> <li>Cooling unit including coolant</li> <li>Grounding cable</li> <li>Water-cooled MIG/MAG welding torch</li> <li>Gas connection (shielding gas supply)</li> <li>Wire electrode</li> </ul>
Manual metal arc welding	<ul> <li>Power source</li> <li>Grounding cable</li> <li>Electrode holder</li> <li>Rod electrodes</li> </ul>
TIG DC Welding	<ul> <li>Power source</li> <li>Grounding cable</li> <li>TIG welding torch with or without rocker switch</li> <li>Gas connection (shielding gas supply)</li> <li>Filler metal depending on application</li> </ul>

## Before installation and initial operation

Safety	
-	WARNING!
	<ul> <li>Operating the device incorrectly can cause serious injury and damage to property.</li> <li>Do not use the functions described here until you have fully read and understood the Operating Instructions.</li> </ul>
	Do not use the functions described here until you have fully read and understood all of the Operating Instructions of the system components, especially the safety rules.
	An electric shock can be fatal. If the power source is connected to the grid during installation, there is a danger of serious personal injury and property damage.
	<ul> <li>Only carry out work on the device when the power source's power switch is in the - O - position.</li> <li>Only carry out work on the device when the power source has been disconnected from</li> </ul>
	the grid.
Intended Use	The power source is only intended for MIG/MAG, MMA and TIG welding. Any other use is deemed to be "not in accordance with the intended purpose." The manufacturer shall not be liable for any damage resulting from such improper use.
	Intended use also means:
	<ul> <li>Following all instructions in the Operating Instructions</li> <li>Carrying out all the specified inspection and maintenance work</li> </ul>
Setup regulations	<ul> <li>The device has been tested according to degree of protection IP 23. This means:</li> <li>Protection against penetration by solid foreign bodies with diameters &gt; 12 mm (0.49 in.)</li> </ul>
	- Protection against spraywater at any angle up to 60° from the vertical
	The device can be set up and operated outdoors in accordance with degree of protection IP 23.
	Direct moisture (e.g., from rain) must be avoided.
	MARNING!
	<ul> <li>Toppling or falling devices can be deadly.</li> <li>▶ Place devices on a solid, level surface so that they remain stable.</li> </ul>
	MARNING!
	Danger of electrical current due to electrically conductive dust in the device.

 This can result in severe personal injury and damage to property.
 Only operate the device if an air filter is fitted. The air filter is a very important safety device for achieving IP 23 protection.

The ventilation channel is a very important safety device. When selecting the setup location, ensure that the cooling air can enter or exit unhindered through the vents on the front and back. Any electrically conductive dust (e.g., from grinding work) must not be allowed to be sucked into the device.

## Grid Connection The dev

The devices are designed for the grid voltage stated on the rating plate. If the mains cable or mains plug has not been attached to your version of the appliance, these must be installed according to national standards. Fuse protection for the grid lead can be found in the technical data.

## 

An inadequately dimensioned electrical installation can lead to serious damage.

The grid lead and its fuse protection should be designed to suit the existing power supply. The technical data on the rating plate should be followed.

## **Connecting the Mains Cable**

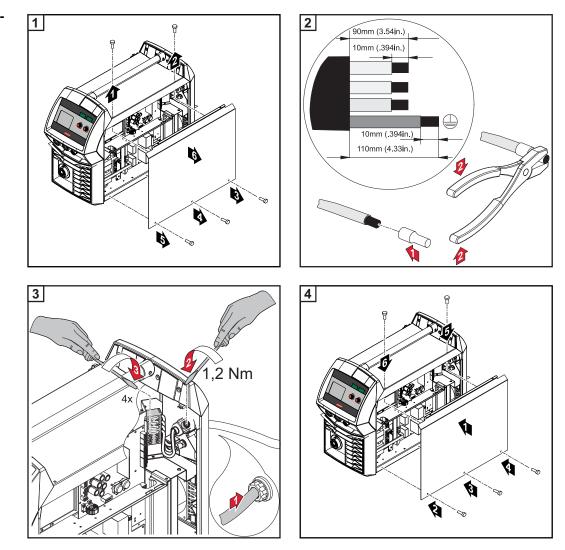

Stipulated mains

cables and strain-

relief devices Europe: Cable cross-section 4G2.5 **USA/Canada:** Cable cross-section AWG 12, extra-hard usage Depending on the version, a strain-relief device corresponding to the cable cross-section is fitted on the power source. The item numbers of the different cables can be found in the Spare Parts List. Safety WARNING! Danger from work that is not carried out properly. This can result in severe personal injury and damage to property. The work described below may only be performed by trained specialist personnel. Follow national standards and guidelines. **CAUTION!** Danger from improperly prepared mains cable. Short circuits and damage to property may result. Fit ferrules to all phase conductors and the ground conductor of the stripped mains cable. Connecting the If no mains cable is connected, a mains cable that is suitable for the connection voltage mains cable must be fitted before commissioning. The ground conductor should be approx. 10 - 15 mm (0.4 - 0.6 in.) longer than the phase conductors. A graphic representation of the mains cable connection is provided in the following sections for fitting the strain-relief device. To connect the mains cable, proceed as follows: Remove the side panel of the device 1 Push in the mains cable so that the ground conductor and phase conductor can be 2 properly connected to the block terminal. Fit a ferrule to the ground conductor and phase conductor Connect the ground conductor and phase conductor to the block terminal 4 Secure the mains cable with a strain-relief device 5 Fit the side panel of the device 6

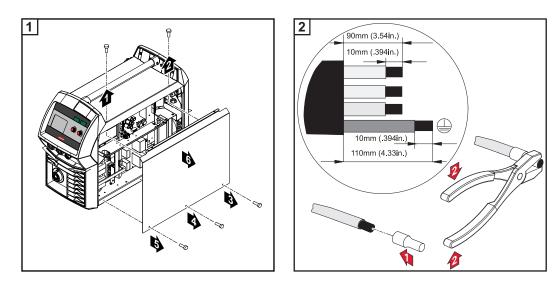

The following mains cables are required to operate the power source:

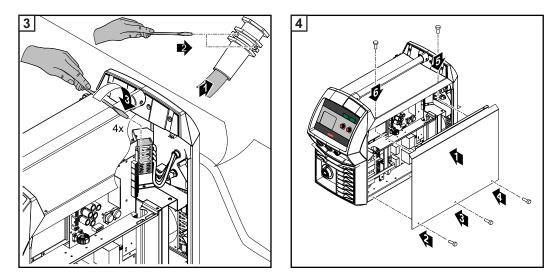

### Fitting the strainrelief device

Fitting the strainrelief device for Canada / US

**IMPORTANT!** Tie the phase conductors near the block terminal using cable ties.

# EN-US

## **Generator-Powered Operation**

Generator-powered operation The power source is generator-compatible.

The maximum apparent power  $S_{1max}$  of the power source must be known in order to select the correct generator output.

The maximum apparent power  ${\rm S}_{1max}$  of the power source is calculated for 3-phase devices as follows:

 $S_{1max} = I_{1max} \times U_1 \times \sqrt{3}$ 

 $I_{1max}$  and  $U_1$  according to the device rating plate and technical data

The generator apparent power  $\mathsf{S}_{\mathsf{GEN}}$  needed is calculated using the following rule of thumb:

```
S_{GEN} = S_{1max} \times 1.35
```

A smaller generator can be used when not welding at full power.

**IMPORTANT!** The generator apparent power  $S_{GEN}$  must not be less than the maximum apparent power  $S_{1max}$  of the power source!

### NOTE!

The voltage delivered by the generator must never fall outside of the mains voltage tolerance range.

The mains voltage tolerance is specified in the "Technical data" section.

## Commissioning

/
/

#### WARNING!

#### An electric shock can be fatal.

If the power source is connected to the grid during installation, there is a danger of serious personal injury and property damage.

- Only carry out work on the device when the power source's power switch is in the O
   - position.
- Only carry out work on the device when the power source has been disconnected from the grid.

#### WARNING!

#### **Danger of electrical current due to electrically conductive dust in the device.** This can result in severe personal injury and damage to property.

Only operate the device if an air filter is fitted. The air filter is a very important safety device for achieving IP 23 protection.

General	Commissioning is described with reference to a manual, water-cooled MIG/MAG applica- tion.
Information on system compo- nents	The steps and activities described below include references to various system compo- nents, such as <ul> <li>Trolley</li> <li>Upright bracket</li> <li>Cooling units</li> <li>Welding torches, etc.</li> </ul>

For more detailed information about installing and connecting the system components, please refer to the appropriate Operating Instructions for the system components.

#### Assembling system components

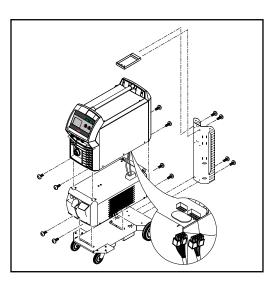

### WARNING!

### Work performed incorrectly can cause serious injury and damage.

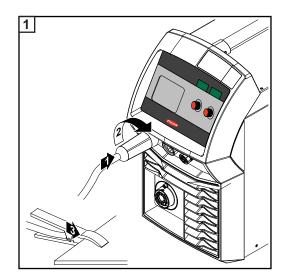

► The following activities must only be carried out by trained and qualified personnel.

Please note the information in the "Safety instructions" chapter!

The following diagram shows an overview of how the individual system components are put together.

## Establishing a ground earth connection

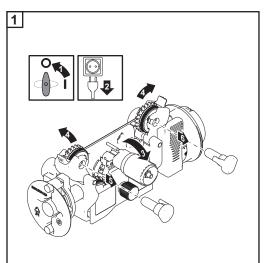

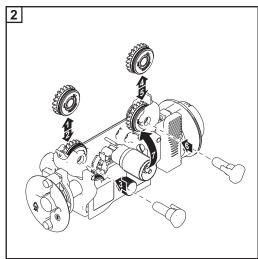

#### Inserting/changing feed rollers

### 

## Danger due to feed roller holders shooting upwards.

- Serious injuries may result.
- When unlocking the clamping lever, keep fingers away from the area to the left and right of the clamping lever.

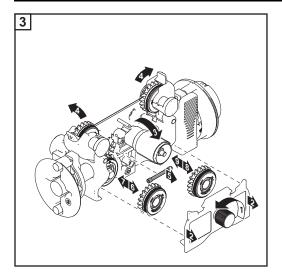

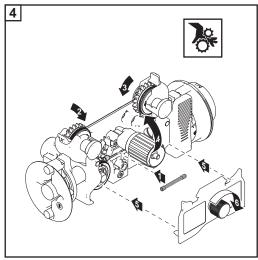

#### 

### Danger due to open feed rollers.

Serious injuries may result.

After inserting/changing the feed rollers, always install the protective cover of the 4 roller drive.

Inserting the wirespool

### 

Risk of injury due to springiness of spooled wire electrode.

When inserting the wirespool, hold the end of the wire electrode firmly to avoid injuries caused by the wire electrode springing back.

## 

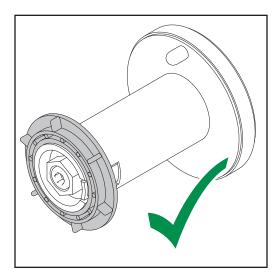

Risk of injury from falling wirespool.

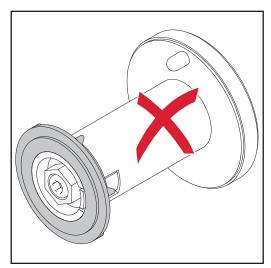

Ensure that the wirespool is fitted securely to the wirespool holder.

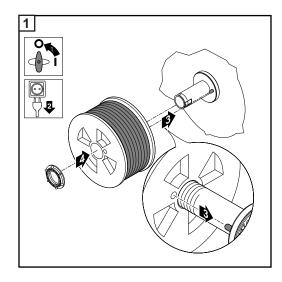

## 

Danger of injury and property damage if the wirespool topples over because the locking ring has been placed the wrong way around.

• Always position the locking ring as shown in the diagram on the left.

#### Installing the basket-type spool

### 

Risk of injury due to springiness of spooled wire electrode.

When inserting the basket-type spool, hold the end of the wire electrode firmly to avoid injuries caused by the wire electrode springing back.

## 

Risk of injury from falling basket-type spool.

Make sure that the basket-type spool with basket-type spool adapter is fitted securely to the wirespool holder.

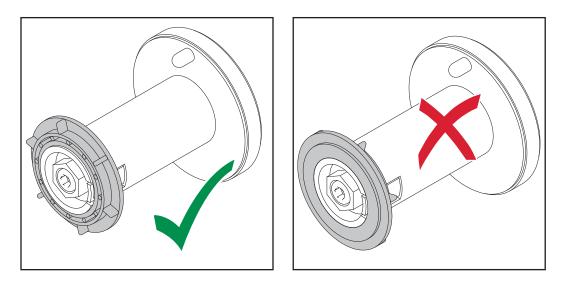

### NOTE!

When working with basket-type spools, only use the basket-type spool adapter supplied with the device.

## 

Danger of injury and property damage if the basket-type spool topples over because the locking ring has been placed the wrong way around.

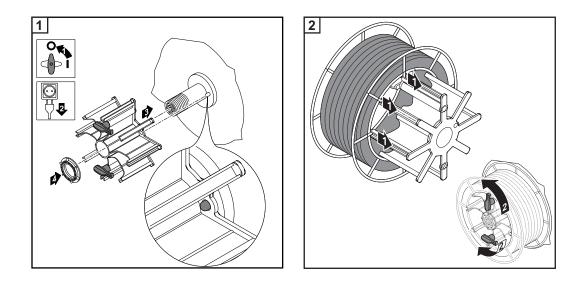

Always position the locking ring as shown in the diagram on the left.

## 

Danger of injury and damage to property due to falling basket-type spool.

Place the basket-type spool on the adapter provided in such a way that the bars on the spool are inside the adapter guideways.

## Feeding in the wire electrode

### 

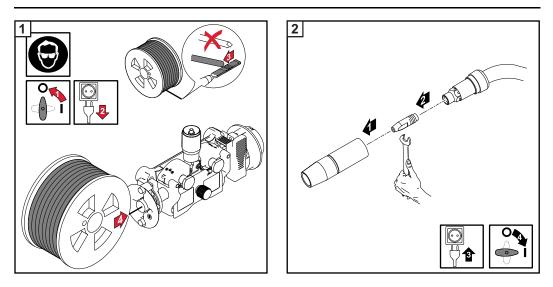

Risk of injury due to springiness of spooled wire electrode.

When inserting the wire electrode into the 4 roller drive, hold the end of the wire electrode firmly to avoid injuries caused by the wire electrode springing back.

### 

Risk of damage to the welding torch from sharp end of wire electrode.

Deburr the end of the wire electrode well before threading in.

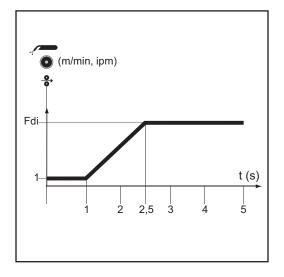

## 

#### Risk of injury from emerging wire electrode.

When pressing the "Wire threading" button or the torch trigger, keep the welding torch away from your face and body, and wear suitable protective goggles.

**IMPORTANT!** To facilitate exact positioning of the wire electrode, the following procedure is possible when the "Wire threading" button is pressed and held down.

- Hold the button for up to **one second** ...the wire speed stays at 1 m/min or 39.37 ipm for the first second.
- Hold the button for up to **2.5 seconds**...after one second, the wire speed increases evenly within the next 1.5 seconds.
- Hold the button for up to **2.5 seconds**...after 2.5 seconds, the wire is fed at a constant rate equal to the wire speed set for the Fdi welding parameter.

If you release the "Wire threading" button and press it again before one second has elapsed, the sequence starts again from the beginning. This makes it possible to continuously position the wire at a low wire speed of 1 m/min or 39.37 ipm where necessary.

If there is no wire threading button present, the **torch trigger** can be used in a similar way. Before using the torch trigger for wire threading, proceed as follows:

- Press the "Mode" button to select 2-step mode
  - Set the "Ito" parameter to "Off" in the Setup menu

### 

#### Danger of injury and damage from electric shock and from the wire electrode emerging from the torch.

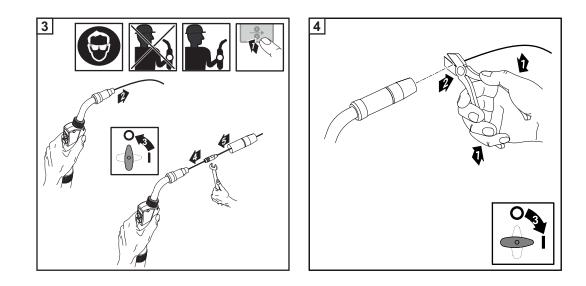

When you press the torch trigger:

- Keep the welding torch away from your face and body
- Wear suitable protective goggles
- Do not point the welding torch at people
- Make sure that the wire electrode does not touch any conductive or grounded parts (e.g., housing, etc.)

**IMPORTANT!** If the **torch trigger** is pressed instead of the "Wire threading" button, the welding wire runs at the feeder creep speed (depending on the welding program) for the first 3 seconds. After these 3 seconds, wirefeeding is briefly interrupted.

The welding system detects that the welding process should not start, but that the wire is to be threaded in. At the same time, the gas solenoid valve closes, and the welding voltage on the wire electrode is switched off.

If the torch trigger is kept pressed, wirefeeding restarts immediately without shielding gas and welding voltage, and the process continues as described above.

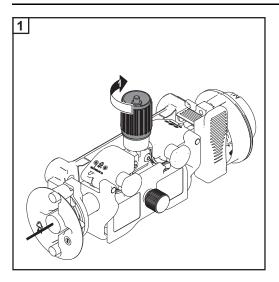

## Set the contact pressure

## 

#### Risk of contact pressure being too high.

This can result in severe damage to property and poor weld properties.

Set the contact pressure in such a way that the wire electrode is not deformed but nevertheless ensures proper wirefeeding.

Contact pressure standard values for Ugroove rollers:

Steel: 4 - 5

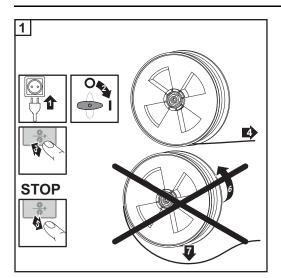

CrNi: 4 - 5

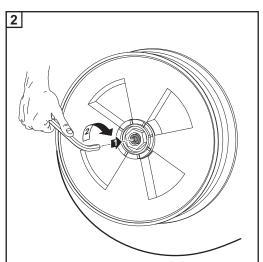

Tubular covered electrodes: 2 - 3

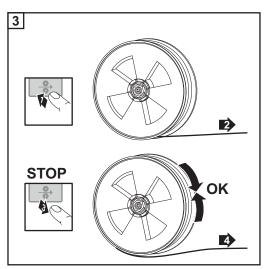

## Adjusting the brake

## NOTE!

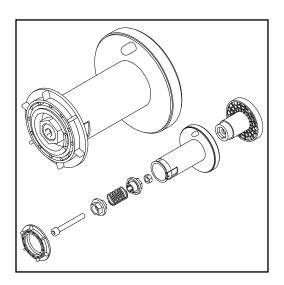

#### Design of the Brake

### WARNING!

## Danger from incorrect installation.

Serious personal injury and damage to property may result.

- ► Do not dismantle the brake.
- Maintenance and servicing of brakes is to be carried out by trained, qualified personnel only.

The brake is only available as a complete unit.

This illustration is for information purposes only.

**MIG/MAG** welding

## **Power Limitation**

#### Safety function

"Power limitation" is a safety function for MIG/MAG welding. This means that the power source can be operated at the power limit whilst maintaining process safety.

Wire speed is a determining parameter for welding power. If it is too high, the arc gets smaller and smaller and may be extinguished. In order to prevent this, the welding power is lowered.

## 0

If the "MIG/MAG standard synergic welding" or "MIG/MAG pulsed synergic welding" process is selected, the symbol for the "Wire speed" parameter flashes as soon as the safety function trips. The flashing continues until the next welding start-up, or until the next parameter change.

If the "Wire speed" parameter is selected, for example, the reduced value for wire speed is displayed.

## **MIG/MAG Operating Modes**

#### General

#### WARNING!

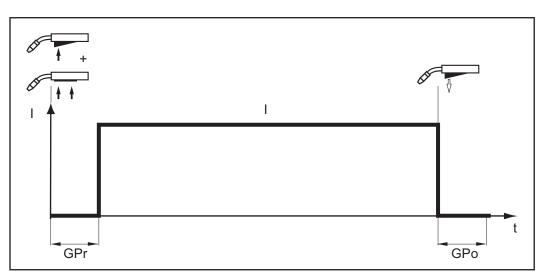

Operating the device incorrectly can cause serious injury and damage to property.

- Do not use the functions described here until you have fully read and understood the Operating Instructions.
- Do not use the functions described here until you have fully read and understood all of the Operating Instructions of the system components, especially the safety rules.

For details of the meaning, settings, setting range and units of the available welding parameters (e.g., gas pre-flow time), please refer to the "Setup parameters" chapter.

Symbols and explanations	Press to	the torch trigger   Hold the torch trigger   Release the torch trigger
	GPr	Gas pre-flow time
	I-S	Starting current Can be increased or decreased depending on the application
	SL	Slope Starting current is continuously lowered as far as the welding current and the weld- ing current as far as the final current
	I	Welding current phase Even heat input into the parent material whose temperature is raised by the ad- vancing heat
	I-E	Final current To fill up end-craters
	GPo	Gas post-flow time
	SPt	Spot welding time / interval welding time
	SPb	Interval pause time

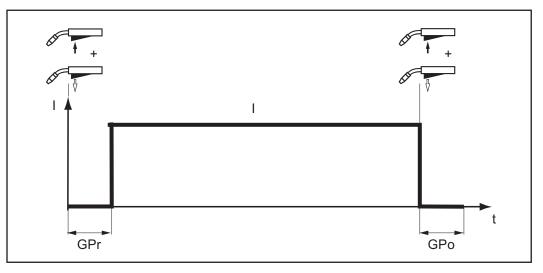

### 2-step mode

"2-step mode" is suitable for

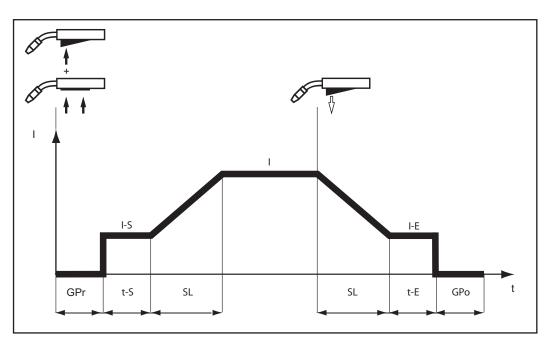

- -
- Tacking work Short weld seams -
- -Automatic and robot operation

### 4-step mode

"4-step mode" is suitable for longer weld seams.

## Special 2-step mode

"Special 2-step mode" is ideal for welding in higher power ranges. In special 2-step mode, the arc starts at a lower power, which makes it easier to stabilize.

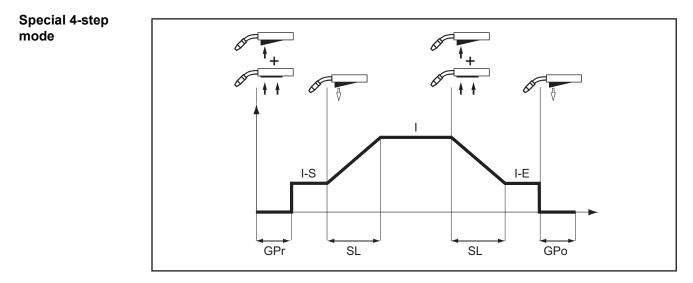

#### To activate special 2-step mode:

Select 2-step mode

2 In the Setup menu, set the t-S (starting current duration) and t-E (final current duration) parameters to a value > 0

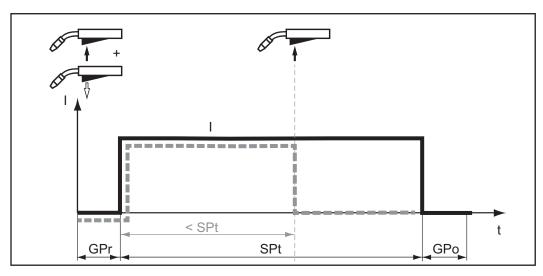

Special 2-step mode is activated.

3 In the Setup menu, set the SL (Slope), I-S (starting current), and I-E (final current) parameters

Special 4-step mode allows the starting and final current to be configured in addition to the advantages of 4-step mode.

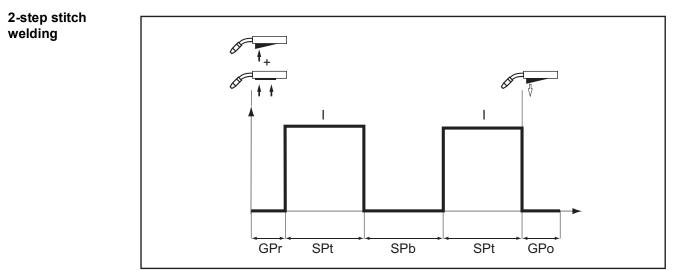

### Spot welding

The "Spot welding" mode is suitable for welded joints on overlapped sheets.

Start by pressing and releasing the torch trigger - GPr gas pre-flow time - welding current phase over the SPt spot welding time duration - GPo gas post-flow time.

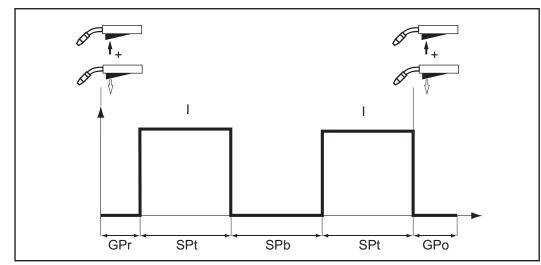

If the torch trigger is pressed again before the end of the spot welding time (< SPt), the process is canceled immediately.

2-step stitch welding

The "2-step stitch welding" mode is suitable for welding short weld seams on thin sheets, to prevent the weld seams from dropping through the parent material.

4-step stitch welding

The "4-step stitch welding" mode is suitable for welding longer weld seams on thin sheets, to prevent the weld seams from dropping through the parent material.

## **MIG/MAG** welding

#### Safety

#### WARNING!

Operating the device incorrectly can cause serious injury and damage to property.

- Do not use the functions described here until you have fully read and understood the Operating Instructions.
- Do not use the functions described here until you have fully read and understood all of the Operating Instructions of the system components, especially the safety rules.

#### WARNING!

#### An electric shock can be fatal.

If the power source is connected to the grid during installation, there is a danger of serious personal injury and property damage.

- Only carry out work on the device when the power source's power switch is in the O
   - position.
- Only carry out work on the device when the power source has been disconnected from the grid.

#### Preparation

Connect the water hoses of the welding torch to the corresponding connection sockets on the cooling unit

(when using the cooling unit and water-cooled welding torch)

2 Insert mains plug
---------------------

3 Set the power switch to - I -:

- All displays on the control panel briefly illuminate
- If present: The cooling unit starts to work

**IMPORTANT!** Observe the safety rules and operating conditions in the Operating Instructions for the cooling unit.

**Overview** 

- MIG/MAG welding is composed of the following sections:
- MIG/MAG synergic welding
- MIG/MAG standard manual welding
- Spot welding and stitch welding

## **MIG/MAG synergic welding**

MIG/MAG syner- gic welding	<ol> <li>Press the "Material" button to select the filler metal to be used.</li> <li>Press the "Wire diameter" button to select the diameter of the wire electrode used.</li> <li>Press the "Shielding gas" button to select the shielding gas to be used. The assignment of the SP position is in the welding program tables in the appendix.</li> <li>Press the "Process" button to select the desired welding process:</li> </ol>
	MIG/MAG standard synergic welding           NULSE SYNERGIC           MIG/MAG pulsed synergic welding
	<ul> <li>Fress the "Mode" button to select the desired MIG/MAG mode:</li> <li>2-step mode</li> <li>4-step mode</li> <li>54T Special 4-step mode</li> </ul>
	<b>IMPORTANT!</b> Under certain circumstances, it may not be possible to change welding parameters that have been set on the control panel of a system component - such as remote control or wirefeeder - on the control panel of the power source.
	<ul> <li>Ise the "Parameter selection" buttons to select the welding parameters to be used to specify the welding power:</li> <li>✓</li> <li>✓&lt;</li></ul>
	V

Welding voltage

Use the appropriate selection dial to set the welding parameter. The value of the parameter is displayed on the digital display located above.

The sheet thickness, welding current, wire speed, and welding voltage parameters are directly linked. It is sufficient to change one of the parameters, as the remaining parameters are immediately adjusted accordingly All welding parameter set values remain stored until the next time they are changed. This applies even if the power source is switched off and on again. To display the actual welding current during welding, select the welding current parameter.

- **8** Open the gas cylinder valve
- **9** Adjust quantity of shielding gas:
  - Tap the Gas-test button
    - Turn the adjusting screw on the bottom of the gas pressure regulator until the manometer displays the desired quantity of gas
    - Tap the Gas-test button again

## 

#### Danger of injury and damage from electric shock and from the wire electrode emerging from the torch.

When you press the torch trigger:

- Keep the welding torch away from your face and body
- Wear suitable protective goggles
- Do not point the welding torch at people
- Make sure that the wire electrode does not touch any conductive or grounded parts (e.g., housing, etc.)

**10** Press the torch trigger and start welding

CorrectionsThe arc length correction and arc-force dynamic parameters can be used to optimize the<br/>welding result.

#### Arc length correction:

- = shorter arc, reduced welding voltage
- 0 = neutral arc
- + = longer arc, increased welding voltage

## Я M

#### Pulse / arc-force dynamic correction

For continuous correction of the droplet detachment force in MIG/MAG pulsed synergic welding

- reduced droplet detachment force
- 0 neutral droplet detachment force
- + increased droplet detachment force

For influencing the short-circuiting dynamic at the instant of droplet transfer during MIG/ MAG standard synergic welding

- = hard, stable arc
- 0 = neutral arc

\_

+ = soft, low-spatter arc

# SynchroPulseSynchroPulse is recommended for welded joints with aluminum alloys whose weld seamsweldingshould have a rippled appearance. This effect is achieved using a welding power that<br/>changes between two operating points.

The two operating points result from a positive and negative change in the welding power to a dFd (delta wire feed) value that can be adjusted in the Setup menu (delta wire feed: 0.0 - 3.0 m/min or 0.0 - 118.1 ipm).

Other parameters for SynchroPulse:

- Frequency F of the operating point change (set in the Setup menu)
- Arc length correction for the lower operating point (set via the arc length correction parameter on the control panel)
- Arc length correction for the higher operating point (set in the Setup menu, parameter AI.2)

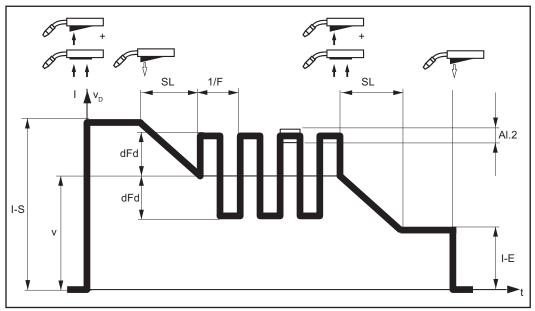

To enable SynchroPulse, you must change at least the value of the F (Frequency) parameter from OFF to a variable in the range of 0.5 to 5 Hz in the process Setup menu.

#### NOTE!

SynchroPulse is not supported with standard manual welding selected.

## How SynchroPulse works when used in "Special 4-step" mode

I-S = starting-current phase, SL = Slope, I-E = crater-fill phase, v = wire speed

SynchroPulse mode of operation

## **MIG/MAG Standard Manual Welding**

General The MIG/MAG standard manual welding process is a MIG/MAG welding process with no synergic function. Changing one parameter does not result in any automatic adjustments to the other parameters. All of the variable parameters must therefore be adjusted individually, as dictated by the welding process in question. Available parame-The following parameters are available for MIG/MAG manual welding: ters 응 Wire speed 1 m/min (39.37 ipm.) - maximum wire speed, e.g., 25 m/min (984.25 ipm.) V Welding voltageTransSteel 4000 Pulse: 15.5 - 31.5 V TransSteel 5000 Pulse: 14.5 - 39 V A Arc-force dynamic: For influencing the short-circuiting dynamic at the instant of droplet transfer Α Welding current Only the actual value is displayed MIG/MAG stan-Press the "Process" button to select the desired welding process: 1 dard manual welding MANUAL MIG/MAG standard manual welding [2] Press the "Mode" button to select the desired MIG/MAG mode: **≜₽**2T 2-step mode **\$ \$** 4T 4-step mode In MIG/MAG standard manual welding, special 4-step mode corresponds to conventional 4-step mode. **IMPORTANT!** Under certain circumstances, it may not be possible to change welding parameters that have been set on the control panel of a system component - such as remote control or wirefeeder - on the control panel of the power source.

Press the "Parameter selection" button to select the wire speed parameter

4

Use the selection dial to set the desired wire speed value

Press the "Parameter selection	" button to select the w	velding voltage parameter
--------------------------------	--------------------------	---------------------------

Use the selection dial to set the desired welding voltage value

The welding parameter values are shown in the digital display located above.

All welding parameter set values remain stored until the next time they are changed. This applies even if the power source is switched off and on again. To display the actual welding current during welding, select the welding current parameter.

To display the actual welding current during welding:

- Press the "Parameter selection" button to select the welding current parameter
- The actual welding current is shown on the digital display during welding.

7 Open the gas cylinder valve

5

6

Adjust quantity of shielding gas:

- Tap the Gas-test button
- Turn the adjusting screw on the bottom of the gas pressure regulator until the manometer displays the desired quantity of gas
- Tap the Gas-test button again

## 

Danger of injury and damage from electric shock and from the wire electrode emerging from the torch.

When you press the torch trigger:

- Keep the welding torch away from your face and body
- Wear suitable protective goggles
- Do not point the welding torch at people
- Make sure that the wire electrode does not touch any conductive or grounded parts (e.g., housing, etc.)

9 Press the torch trigger and start welding

**Corrections** To obtain the best possible welding results, the arc-force dynamic parameter will sometimes need to be adjusted.

Press the "Parameter selection" button to select the arc-force dynamic parameter

## Я M

**Use the selection dial to set the desired arc-force dynamic value** 

The welding parameter value is shown in the digital display located above it.

## **Spot and Stitch Welding**

	The spot welding and stitch welding modes are MIG/MAG welding processes. The spot welding and stitch welding modes are activated on the control panel.
	Spot welding is used on welded joints on overlapping sheets that are only accessible on one side.
	Stitch welding is used for light-gage sheets. As the wire electrode is not fed continuously, the weld pool can cool down during the inter- vals. Local overheating leading to the parent material being melted through is largely avoided.
Spot welding	1 In the Setup menu, set the spot welding time / stitch welding time SPt
	<b>IMPORTANT!</b> Stitch pause time SPb = OFF must be set for spot welding!
	<ul> <li>Only for synergic welding:</li> <li>Use the corresponding buttons to select the filler metal used, the wire diameter, and the shielding gas</li> </ul>
	3 Select the desired welding process:
	MANUAL MIG/MAG standard manual welding
	STD SYNERGIC  MIG/MAG standard synergic welding
	PULSE SYNERGIC  MIG/MAG pulsed synergic welding
	Select spot welding/stitch welding mode:
	Spot welding/stitch welding The spot/stitch/SynchroPulse (SF) indicator lights up on the control panel.
	5 Depending on the welding process selected, select the desired welding parameters and adjust them using the appropriate selection dial
	6 Open the gas cylinder valve
	7 Adjust quantity of shielding gas
	<ul> <li>Danger of injury and damage from electric shock and from the wire electrode emerging from the torch.</li> <li>When you press the torch trigger:</li> <li>Keep the welding torch away from your face and body</li> <li>Wear suitable protective goggles</li> <li>Do not point the welding torch at people</li> <li>Make sure that the wire electrode does not touch any conductive or grounded parts (e.g., housing, etc.)</li> </ul>

10 Stitch welding

#### Procedure for stitch welding:

1	Keep the welding torch vertical
2	Depending on the stitch mode set under the Int parameter: Press and hold the torch trigger (2-step mode) Press and release the torch trigger (4-step mode)
3	Maintain the position of the welding torch
4	Wait for the welding interval
5	Position the welding torch at the next point
6	To stop stitch welding, depending on the stitch mode set under the Int parameter: Release the torch trigger (2-step mode) Press and release the torch trigger (4-step mode)
7	Wait for the gas post-flow time
8	Raise the welding torch

## EasyJob mode

General	The "Save" buttons allow up to five EasyJob operating points to be saved. Each operating point corresponds to the settings made on the control panel.
	EasyJobs can be stored for each welding process.
	<b>IMPORTANT!</b> Setup parameters are not saved at this time.
Saving EasyJob operating points	1 Press and hold one of the "Save" buttons to save the current settings on the control panel, e.g.
	<ul> <li>The left display reads "Pro"</li> <li>After a short time, the left display switches to the original value</li> <li>Release the "Save" button</li> </ul>
Retrieving Easy- Job operating points	To retrieve saved settings, press the corresponding "Save" button briefly, e.g.
	- The control panel will show the saved settings
Deleting EasyJob operating points	Press and hold the relevant "Save" button to delete the memory content of that "Save" button, e.g.
	1
	<ul> <li>The left display reads "Pro".</li> <li>After a short time, the left display switches to the original value</li> </ul>
	<ul> <li>Keep the "Save" button held down</li> <li>The left display reads "CLr".</li> <li>After a while, both displays show ""</li> </ul>
	3 Release the "Save" button

Retrieving Easy-Job operating points on the Up/ Down welding torch Press one of the "Save" buttons on the control panel to retrieve the saved settings using the Up/Down welding torch.

**1** Press one of the "Save" buttons on the control panel, e.g.:

The control panel will show the saved settings.

The "Save" buttons can now be selected using the buttons on the Up/Down welding torch. Vacant "Save" buttons are skipped.

In addition to the "Save" button number lighting up, a number is displayed directly on the Up/Down welding torch:

Display on the Up/Down welding torch	EasyJob operating point on the control panel

# **TIG welding**

### **TIG welding**

Safety

#### WARNING!

#### Danger due to incorrect operation.

This can result in severe personal injury and damage to property.

- Do not use the functions described here until you have fully read and understood the Operating Instructions.
- Do not use the functions described here until you have fully read and understood all of the Operating Instructions of the system components, especially the safety rules.

#### WARNING!

#### An electric shock can be fatal.

If the power source is connected to the grid during installation, there is a danger of serious personal injury and property damage.

- Only carry out work on the device when the power source's power switch is in the O
   - position.
- Only carry out work on the device when the power source has been disconnected from the grid.

#### Preparation

Set the power switch to - O -

- 2 Unplug mains plug
- 3 Removing a MIG/MAG welding torch
- **4** Disconnect the grounding cable from the (-) current socket
- **5** Insert the grounding cable into the (+) current socket and lock
- **6** Connect the other end of the grounding cable to the workpiece
- 7 Insert the bayonet connector of the TIG welding torch into the (-) current socket and twist it clockwise to lock
- **8** Screw the pressure regulator onto the gas cylinder (argon) and tighten it
- **9** Connect the gas hose to the pressure regulator and the TIG gas connection to the power source
- 10 Insert mains plug

#### **TIG welding**

#### 

#### Danger of injury and damage from electric shock.

When the power switch is switched to position - I -, the tungsten electrode of the welding torch is live.

Ensure that the tungsten electrode is not touching any people or electrically conductive or grounded parts (housing, etc.).

Set the power switch to position - I -: all indicators on the control panel briefly illuminate

Press the "Process" button to select the TIG welding process:

The welding voltage is applied to the welding socket with a three second time lag.

**IMPORTANT!** Under certain circumstances, it may not be possible to change welding parameters that have been set on the control panel of a system component - such as wirefeeder or remote control - on the control panel of the power source.

6

2

Press the "Parameter selection" button to select the amperage parameter.

**4** Use the selection dial to set the desired amperage.

The amperage value is shown on the left-hand digital display.

All the parameter set values set using the selection dial are saved until the next time they are changed. This applies even if the power source is switched off and on again.

**5** Set the desired amount of shielding gas on the pressure regulator

Commence welding process (ignite arc)

## Igniting the arc When using a welding torch with a torch trigger and TIG Multi Connector plug (with 2-step mode factory setting):

	1	2	3 + 4
	2 to 3 mm (0.078 to 0.11) 2 Gradually tilt the welding	t the ignition point so that there 8 in.) between the tungsten ele torch up until the tungsten ele r and hold it in this position	ectrode and the workpiece
	The arc now ignites.	and tilt it into the normal positio	n
Ending the weld-	<ul><li>5 Carry out welding</li><li>1 Raise the TIG welding to</li></ul>	rch off the workpiece until the	arc goes out.
ing process	Important! To protect the	e tungsten electrode, allow the ungsten electrode has cooled	shielding gas to flow after the
	2 Release the torch trigger		

### **Pulse welding**

Applications	Pulsed welding is welding with a pulsing welding current. It is used to weld steel pipes out- of-position or to weld thin sheet metal.			
	<ul> <li>In these applications, the welding current set at the start of welding is not always optimum for the entire welding process:</li> <li>If the amperage is too low, the parent material will not be melted enough</li> <li>If overheating occurs, there is a danger that the liquid weld pool may drip.</li> </ul>			
Operating princi- ple	<ul> <li>A low base current I-G rises steeply to the significantly higher pulse current I-P and drops back to the base current I-G after the Duty cycle dcY time.</li> <li>This results in an average current that is lower than the set pulse current I-P.</li> <li>During pulse welding, small sections of the welding location melt quickly and then rap-</li> </ul>			

idly re-solidify.

The power source controls the "Duty cycle dcY" and "Base current I-G" parameters according to the set pulse current (welding current) and pulse frequency.

Welding current progression curve

#### Adjustable parameters:

I-S	Starting current	
I-E	Final current	
F-P	Pulse frequency (1/F-P = Time between two pulses)	
I-P	Pulse current (set welding current)	

#### Fixed parameters:

<b>t</b> up	UpSlope
<b>t</b> <sub>down</sub>	DownSlope
dcY	Duty cycle
I-G	Base current

## Activating pulse welding

Set a value for the F-P setup parameter (pulse frequency) - Setting range: 1 - 990 Hz

For a parameter description see section **Parameters for TIG welding** from page **98**.

# **Manual Metal Arc Welding**

### Manual Metal Arc Welding

#### Safety

#### WARNING!

Operating the device incorrectly can cause serious injury and damage to property.

- Do not use the functions described here until you have fully read and understood the Operating Instructions.
- Do not use the functions described here until you have fully read and understood all of the Operating Instructions of the system components, especially the safety rules.

#### WARNING!

#### An electric shock can be fatal.

If the unit is connected to the grid during installation, there is a danger of serious injury and damage to property.

- Only carry out work on the device if the power switch is in the O position.
- Only carry out work on the device when it has been disconnected from the grid.

#### Preparation

Set the power switch to - O -

2 Unplug mains plug

**IMPORTANT!** Check the rod electrode packaging to determine whether the rod electrodes are for (+) or (-) welding.

- 3 Depending on the type of electrode, insert the grounding cable into the (-) current socket or into the (+) current socket and twist it clockwise to lock
- [4] Connect the other end of the grounding cable to the workpiece
- 5 Depending on the type of electrode, insert the bayonet connector of the electrode holder cable into the free current socket with opposite polarity and twist it clockwise to lock
- 6 Insert mains plug

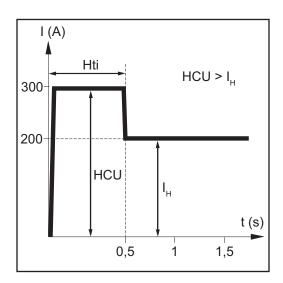

Manual metal arc					
welding					
	<b>Danger of injury and damage from electric shock.</b> When the power switch is switched to position - I -, the rod electrode in the electrode holder is live.				
	Ensure that the rod electrode is not touching any people or electrically conductive or grounded parts (housing, etc.).				
	<ol> <li>Set the power switch to position - I -: all indicators on the control panel briefly illuminate</li> <li>Press the "Process" button to select the MMA welding process:</li> </ol>				
	The welding voltage is applied to the welding socket with a three second time lag. If the MMA welding process is selected, a cooling unit, if present, is automatically de- activated. It is not possible to turn it on.				
	<b>IMPORTANT!</b> Under certain circumstances, it may not be possible to change welding parameters that have been set on the control panel of a system component - such as remote control or wirefeeder - on the control panel of the power source.				
	<ul> <li>3 Press the "Parameter selection" button to select the amperage parameter.</li> <li>4 Use the selection dial to set the desired amperage.</li> </ul>				
	The amperage value is displayed on the left-hand digital display.				
	All parameter set values that are set using the selection dial are saved until their next alteration. This applies even if the power source is switched off and on again.				
	5 Initiate welding process				
	<ul> <li>To display the actual welding current during welding:</li> <li>Press the "Parameter selection" button to select the welding current parameter</li> <li>The actual welding current is shown on the digital display during welding.</li> </ul>				
Corrections during welding	To obtain the best possible welding results, the arc-force dynamic parameter will some- times need to be adjusted.				
	<ol> <li>Press the "Parameter selection" button to select the arc-force dynamic parameter</li> <li>Use the selection dial to set the desired arc-force dynamic value</li> <li>The welding parameter value is shown in the digital display located above it</li> </ol>				
	<ul> <li>The welding parameter value is shown in the digital display located above it.</li> <li>To influence the short-circuiting dynamic at the instant of droplet transfer:</li> <li>= hard, stable arc</li> <li>= neutral arc</li> <li>+ = soft, low-spatter arc</li> </ul>				

**HotStart function** To obtain the best possible welding result, the HotStart function will sometimes need to be adjusted.

#### Advantages

- Improved ignition properties, even when using electrodes with poor ignition properties
- Better fusion of the parent material during the start-up phase, meaning fewer cold-shut defects
- Slag inclusions largely avoided

The setting of the available parameters is described in the section "Setup settings", "Setup menu - level 2".

Key Hti Hot-current time, 0 - 2 s, Factory setting 0.5 s HCU HotStart current, 100 - 200%,

I<sub>H</sub> Main current = set welding current

Factory setting 150%

#### **Function**

During the specified hot-current time (Hti), the welding current is increased to a certain value. This value (HCU) is higher than the selected welding current  $(I_H)$ .

Anti-Stick func-<br/>tionAs the arc becomes shorter, the welding voltage may also fall so that the rod electrode is<br/>more likely to stick to the workpiece. This may also cause the rod electrode to burn out.

Electrode burn-out is prevented by activating the anti-stick function. If the rod electrode begins to stick, the power source immediately switches the welding current off. The welding process can be resumed without problems once the rod electrode has been detached from the workpiece.

The anti-stick (Ast) function can be activated and deactivated in the Setup menu for the setup parameters for MMA welding.

# **Setup Settings**

# EN-US

### Setup Menu

General The Setup menu offers easy access to expert knowledge related to the power source, as well as additional functions. The Setup menu makes it possible to easily adjust the parameters for various tasks. Operation Accessing the Setup menu is described with reference to the MIG/MAG standard synergic welding process. Access is the same for the other welding processes. Accessing the Setup menu Press the "Process" button to select 1 the "MIG/MAG standard synergic welding" process: Press and hold the "Mode" button **≜**≢ 2T **‡**≢ 4T 2 Press the "Process" button 3 GIC 🗖 Release the "Mode" and "Process" ## 2T ## 4T 4 :::: buttons The control panel is now located in the Setup menu of the "MIG/MAG standard synergic welding" process - the last selected setup parameter is displayed. Adjusting parameters Select the desired setup parameter 1 using the left-hand selection dial Change the setup parameter value 2 using the right-hand selection dial Exiting the Setup menu Press and hold the "Mode" button **\$**₹2T \$\$4T 1 .... Press the "Process" button 2 Release the "Mode" and "Process" **1**≢ 2T \$\$ 4T 541 ==== 3 + buttons

#### The specifications "min." and "max." are used for setting ranges that vary according to the Setup parameters for MIG/MAG synpower source, welding program, etc. ergic welding GPr Gas pre-flow time Unit: s Setting range: 0 - 9.9 Factory setting: 0.1 GPo Gas post-flow time Unit: s Setting range: 0 - 9.9 Factory setting: 0.5 SL Slope (for special 2-step mode and special 4-step mode) Unit: s Setting range: 0 - 9.9 Factory setting: 0.1 I-S Starting current (for special 2-step mode and special 4-step mode) Unit: % (of welding current) Setting range: 0 - 200 Factory setting: 100 I-E Final current (for special 2-step mode and special 4-step mode) Unit: % (of welding current) Setting range: 0 - 200 Factory setting: 50 t-S Starting current duration (only for special 2-step mode) Unit: s Setting range: 0.0 - 9.9 Factory setting: 0.0 t-E Final current duration (only for special 2-step mode) Unit: s Setting range: 0.0 - 9.9 Factory setting: 0.0 Fdi Feeder inching speed Unit: m/min (ipm) Setting range: 1 - max (39.37 - max) Factory setting: 10 (393.7) bbc Burnback effect Burnback effect due to wire retraction at the end of welding When the welding current is switched off, the wire electrode is retracted at 7.5 m/ min for the duration of the set bbc value. Unit: s Setting range: 0 - 0.2 Factory setting: 0 Ito Length of wire that is fed before the safety cut-out trips Unit: mm (in.) Setting range: OFF, 5 - 100 (OFF, 0.2 - 3.94) Factory setting: OFF

#### NOTE!

The Ito function (length of wire fed until safety cut-out trips) is a safety function. At high wire speeds in particular, the length of wire fed until the safety cut-out trips can deviate from the set wire length.

SPt	<b>Spot welding time / interval welding time</b> Unit: s
	Setting range: 0.3 - 5 Factory setting: 1
SPb	Interval pause time Unit: s Setting range: OFF, 0.3 - 10 (in 0.1 s increments)
	Factory setting: OFF
	<b>IMPORTANT!</b> SPb = OFF must be set for spot welding!
Int	<b>Interval</b> Displayed only if a value has been set for SPb Unit:
	Setting range: 2T (2-step), 4T (4-step) Factory setting: 2T (2-step)
F	Frequency for SynchroPulse Unit: Hz
	Setting range: OFF, 0.5 - 5 Factory setting: OFF
dFd	Delta wire feed Offset welding power for SynchroPulse option
	Unit: m/min (ipm) Setting range: 0 - 3 (0 - 118.1)
	Factory setting: 2 (78.7)
AL2	Arc length correction for upper SynchroPulse operating point Unit: % (of welding power)
	Setting range: 30 - +30 Factory setting: 0
FAC	Reset power source to factory settings
	Press and hold one of the "Parameter selection" buttons for two seconds to restor the factory settings - when "PrG" appears on the digital display, the power source has been reset
	<b>IMPORTANT!</b> If the power source is reset, all the personal settings in the Setup menu are lost.
	Operating points stored using save buttons remain stored when the power sourc is reset. The functions in the second level of the setup menu (2nd) are also not d leted. Exception: Ignition time-out function parameter (ito).

tandard manual relding	GPr	Gas pre-flow time
lang	011	Unit: s
		Setting range: 0 - 9.9
		Factory setting: 0.1
	GPo	Gas post-flow time
		Unit: s
		Setting range: 0 - 9.9
		Factory setting: 0.5
	Fdi	Feeder inching speed
		Unit: m/min (ipm)
		Setting range: 1 - max (39.37 - max)
		Factory setting: 10 (393.7)
	bbc	Burnback effect
		Burnback effect due to a delayed switch-off of the welding current after the wire electrode has come to a stop. A ball forms on the wire electrode.
		Unit: s
		Setting range: AUt, 0 - 0.3
		Factory setting: AUt
	IGC	Ignition current
		Unit: A
		Setting range: 100 - 650 Factory setting: 500
	lto	Length of wire that is fed before the safety cut-out trips
		Unit: mm (in.)
		Setting range: OFF, 5 - 100 (OFF, 0.2 - 3.94)
		Factory setting: OFF

2nd Second level of the Setup menu (see "Setup Menu 2nd Level")		-	Country-specific setting
		2nd	Second level of the Setup menu (see "Setup Menu 2nd Level")

### Setup Menu 2nd Level

**Limitations** The following restrictions occur in relation to the Setup menu 2nd level:

Setup menu 2nd level cannot be selected:

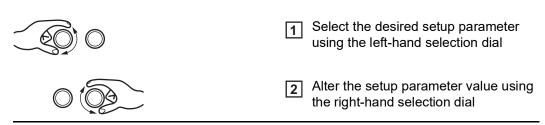

- during welding
- if the "Gas test" function is active
- if the "Wire threading" function is active
- if the "Wire withdrawal" function is active
- if the "Gas purging" function is active

If level 2 of the Setup menu is selected, the following functions are not available, even in robot mode:

- Welding start-up the "Power source ready" signal will not be emitted for robot mode
- Gas test
- Wire inching
- Wire withdrawal
- Gas purging

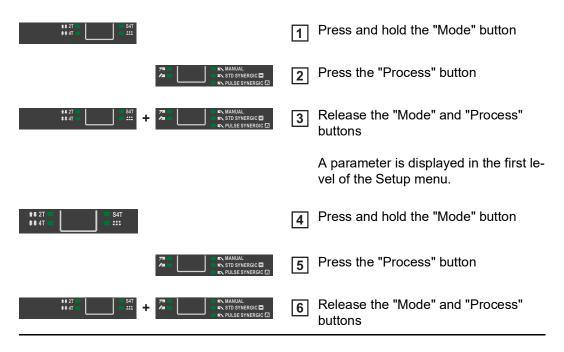

#### **Operation (Setup** Accessing the 2nd level of the Setup menu: Menu 2nd Level) Press the "Process" button to select 1 IERGIC 🗖 the "MIG/MAG standard synergic welding" process: Press and hold the "Mode" button **1 ≢** 2T **‡ ‡** 4T 2 Press the "Process" button 3 GIC 🗖 Release the "Mode" and "Process" 4 buttons Select the "2nd" setup parameter using 5 the left-hand selection dial Press and hold the "Mode" button 6 \$\$ 4T Press the "Process" button 7 ## 2T ## 4T Release the "Mode" and "Process" 8 6 STD SYNERGIC

Parameters for MIG/MAG syner-	SEt	Country-specific setting (Standard/USA) Hour/US
gic welding in		Unit:
Setup menu 2nd		Setting range: Std, US (Standard/USA)
evel		Factory setting:
		Standard version: Std (dimensions: cm / mm) USA version: US (dimensions: in.)
	Syn	Synergic programs/characteristics Standards EN / AWS
		Unit: Setting range: EUr / US Factory setting: Standard version: EUr USA version: US
	C-C	Cooling unit control
		(only when the cooling unit is connected)
		Unit:
		Setting range: AUt, On, OFF Factory setting: AUt
		AUt: The cooling unit cuts out after a 2-minute welding off-time.
		<b>IMPORTANT!</b> If the coolant temperature and flow monitoring options have been installed in the cooling unit, the cooling unit cuts out as soon as the return-flow tem perature drops below 50 °C, but at the earliest after a 2-minute welding off-time.
		On: The cooling unit is always switched on.
		OFF: The cooling unit is always switched off.
		<b>IMPORTANT!</b> If the FAC welding parameter is used, the C-C parameter is not reset to the factory setting. If the MMA welding process is selected, the cooling unit is always switched off, even if the switch is in the "On" position.
	C-t	Cooling time
		(only when the cooling unit is connected)
		Time from when flow monitoring is triggered until the "no   H2O" service code is ou put. For example, if there are air bubbles in the cooling system, the cooling unit will not cut out until the end of this preset time.
		Unit: s
		Setting range: 5 - 25 Factory setting: 10
		<b>IMPORTANT!</b> Every time the power source is switched on, the cooling unit carries out a test run for 180 seconds.

See the section "Measuring the welding circuit resistance r" from page **106**.

L	Welding circuit inductivity (in microhenrys) See the section "Displaying the welding circuit inductivity L" from page 108.
EnE	Electrical energy of the arc in relation to the welding speed
	Unit: kJ
	Setting range: On / OFF
	Factory setting: OFF
	Since the full range of values (1 kJ - 99999 kJ) cannot be displayed on the three- digit display, the following display format has been selected:
	Value in kJ / indicator on display: 1 to 999 / 1 to 999
	1000 to 9999 / 1.00 to 9.99 (without unit digit, e.g., 5270 kJ -> 5.27)
	10000 to 99999 / 10.0 to 99.9
	(without unit or tens digit, e.g., 23580 kJ -> 23.6)
ALC	Correction of the arc length via the welding voltage
	Only for MIG/MAG synergic welding
	Setting range: On / OFF
	Factory setting: OFF
	The arc length depends on the welding voltage. The welding voltage can be indi- vidually adjusted in synergic operation.
	If the ALC parameter is set to "OFF", individual adjustment of the welding voltage is not possible. The welding voltage adjusts automatically according to the selected welding current or wire speed. When the arc length correction is adjusted, the volt- age changes while the welding current rand the wire speed remain constant. When adjusting the arc length correction using the selection wheel, the left display is used for the correction value of the arc length. On the right display, the value for the welding voltage changes at the same time. The left display then shows the original value again, e.g., welding current.

### Measuring the Welding Circuit Resistance r

**General** Measuring the welding circuit resistance makes it possible to have a constant welding result at all times, even with hosepacks of different lengths. The welding voltage at the arc is then always precisely regulated, regardless of the length and cross-sectional area of the hosepack. The use of arc length correction is no longer required.

The calculated welding circuit resistance is shown on the display.

r = welding circuit resistance in milliohm (mOhm)

If the welding circuit resistance has been measured correctly, the set welding voltage will correspond exactly to the welding voltage at the arc. If you manually measure the voltage on the output jacks of the power source, this voltage will be higher than the welding voltage at the arc - that is, higher by the same amount as the voltage drop of the hosepack.

The welding circuit resistance depends on the hosepack used:

- If the length or cross-sectional area of the hosepack has changed, measure the welding circuit resistance again
- Measure the welding circuit resistance for every welding process separately with the appropriate welding power-leads

Measuring the welding circuit resistance (MIG/ MAG welding)

#### NOTE!

Incorrect measurement of the welding circuit resistance can have a negative effect on the welding result.

- Ensure that the workpiece has an optimum contact surface in the area of the earthing clamp (clean surface, no rust, etc.).
- 1 Make sure that one of the MANUAL / STD SYNERGIC / pulsed synergic welding processes is selected
- 2 Establish a ground earth connection to the workpiece
- 3 Access the Setup menu 2nd level (2nd)
- 4 Select parameter "r"
- **5** Remove the gas nozzle from the welding torch
- 6 Screw on the contact tip
- [7] Ensure that the wire electrode does not protrude from the contact tip

#### NOTE!

8

Incorrect measurement of the welding circuit resistance can have a negative effect on the welding result.

Ensure that the workpiece has an optimum contact surface for the contact tip (clean surface, no rust, etc.).

Press the torch trigger briefly

The welding circuit resistance is calculated. "run" is shown on the display during the measurement

The measurement is finished when the welding circuit resistance is shown on the display in mOhm (for example 11.4).

Measuring the welding circuit resistance (MMA welding)

#### NOTE!

Incorrect measurement of the welding circuit resistance can have a negative effect on the welding result.

- Ensure that the workpiece has an optimum contact surface in the area of the earthing clamp (clean surface, no rust, etc.).
- 1 Ensure that the Stabelektroden-Schweißen welding process is selected
- 2 Establish a ground earth connection to the workpiece
- 3 Access the Setup menu 2nd level (2nd)
- 4 Select parameter "r"

#### NOTE!

Incorrect measurement of the welding circuit resistance can have a negative effect on the welding result.

Ensure that the workpiece has an optimum contact surface for the electrode (clean surface, no rust, etc.).

5 Place the electrode flush against the workpiece surface

6 Press the "Parameter selection" button (right)

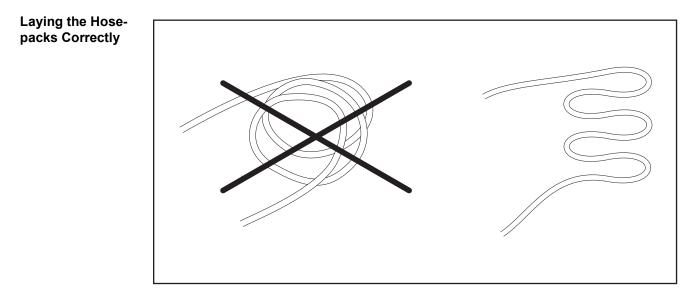

The welding circuit resistance is calculated. During the measurement the display shows "run".

The measurement is finished when the welding circuit resistance is shown on the display in mOhm (for example 11.4).

## **Displaying the welding circuit Inductivity L**

The way that the hosepack is arranged has a very significant effect on the welding circuit inductivity and therefore affects the welding process. It is important to lay the hosepacks correctly in order to obtain the best possible welding result.
The setup parameter "L" is used to display the most recently calculated welding circuit in- ductivity. The welding circuit inductivity is adjusted when the welding circuit resistance is measured. Detailed information in this regard can be found under the "Welding circuit re- sistance" chapter.
<ol> <li>Access the Setup menu 2nd level (2nd)</li> <li>Select parameter "L"</li> </ol>
The most recently calculated welding circuit inductivity L is shown on the right-hand digital display.
L Welding circuit inductivity (in microhenrys)

# **Troubleshooting and Maintenance**

# EN-US

### Troubleshooting

#### General

The devices are equipped with an intelligent safety system, which largely negates the need for melting-type fuses. Melting-type fuses therefore no longer need to be replaced. After a possible malfunction has been remedied, the device is ready for use again.

### Safety

### 🕺 WARNING!

#### Work performed incorrectly can cause serious injury and damage to property.

- Only trained and qualified personnel may carry out the activities described in the following.
- Follow the safety rules in the power source Operating Instructions

### WARNING!

### An electric shock can be fatal.

Before opening the device:

- Set the power switch to O -
- Unplug the device from grid power
- Attach a clear warning sign advising others not to switch the power source back on
- Use a suitable measuring instrument to ensure that electrically charged components (e.g., capacitors) are discharged

### WARNING!

### An inadequate ground conductor connection can cause serious injury and damage to property.

The housing screws act as a ground conductor connection for grounding the housing.

The housing screws must not under any circumstances be replaced by other screws without a reliable ground conductor connection.

### Displayed Service<br/>CodesIf an error message that is not described here appears on the displays, first try to resolve<br/>the problem as follows:

Switch the power source power switch to the -O- position

- 2 Wait 10 seconds
- 3 Switch the power switch to the -I- position

If the error occurs again despite several attempts to eliminate it, or if the troubleshooting measures listed here are unsuccessful.

_	
1	l N

Aake a note of the error message displayed

Note down the configuration of the power source

Contact our After-Sales Service team with a detailed description of the error

<b>ESr   20</b> Cause: Remedy:	The cooling unit used is not compatible with the power source Connect compatible cooling unit

Remedy:	Select a configured program
no   IGn	
Cause:	"Ignition time-out" function is active; current did not start flowing before the length of wire specified in the Setup menu had been fed. The power source safety cut-out has tripped
Remedy:	Shorten the wire stick-out; press the torch trigger again; clean the surface of the workpiece; if necessary, set the "Ito" parameter in the Setup menu
EPG   17	
Cause:	The selected welding program is invalid
Remedy:	Select a valid welding program
EPG   29	
Cause:	The required wirefeeder is not available for the selected characteristic
Remedy:	Connect the correct wirefeeder, check the plug connections for the hosepack
EPG   35	
Cause:	Measurement of the welding circuit resistance failed
Remedy:	Check grounding cable, current cable, or hosepack and replace if necessary, re-measure the welding circuit resistance

### Service, maintenance and disposal

_				_
G	er	le	ra	

Under normal operating conditions, the welding system requires only a minimum of care and maintenance. However, several points must be observed in order for the welding system to remain operational for years to come.

### Safety

### WARNING!

### An electric shock can be fatal.

Before opening the device

- Set power switch to O on the welding power supply
- Unplug the welding power supply from mains power
- Secure against anyone turning on power again
- Use a suitable measuring instrument to ensure that electrically charged components (e.g., capacitors) are discharged

### WARNING!

Work performed incorrectly can cause serious injury and damage.

- The following activities must only be carried out by trained and qualified personnel.
- Please note the information in the "Safety instructions" chapter!

#### At every start-up

- Check mains plug and mains cable, as well as the welding torch, interconnecting hosepack, and ground earth connection for damage
  - Check if the all-round clearance of the device is 0.5 m (1 ft. 8 in.) so that cooling air can circulate unimpeded

#### NOTE!

Air inlet and outlet openings must not be blocked or even partially covered.

**Whenever re-** Remove the air filter on the rear of the housing from the side and clean it. **quired** 

**Every 2 Months** 

### 

### Danger of damage to property.

- ► The air filter must only be fitted when dry.
- ▶ If required, clean air filter using dry compressed air or by washing it.

Every 6 Months							
	Danger due to the effect of compressed air. This can result in damage to property.						
	Do not bring the air nozzle too close to electronic parts.						
	Dismantle device side panels and blow the inside of the device clean with dry, reduced compressed air						
	2 Also clean the cooling air ducts if there is a large accumulation of dust						
	An electric shock can be fatal. Danger of electric shock due to grounding cable and device grounding points not being connected properly.						
	When refitting the side panels, ensure that the grounding cable and device grounding points are properly connected.						

Disposal

Materials should be disposed of according to valid local and national regulations.

## Appendix

### **Technical data**

 Special Voltage
 For devices designed for special voltages, the technical data on the rating plate applies.

 The following applies for all devices with a permitted grid voltage of up to 460 V: The standard mains plug allows the user to operate with a grid voltage of up to 400 V. For grid voltages up to 460 V fit a mains plug permitted for such use or install the mains supply directly.

 Explanation of the Term Duty Cycle
 The duty cycle (D.C.) is the period of a ten minute cycle in which the device may be operated at the stated power without overheating.

 NOTE!
 The D.

C. values cited on the rating plate relate to an ambient temperature of 40 °C. If the ambient temperature is higher, the D.C. or power must be lowered accordingly.

Example: Welding with 150 A at 60% D.C.

- Welding phase = 60% of 10 mins = 6 mins
- Cool-down phase = rest time = 4 mins
- Following the cool-down phase, the cycle begins again.

To use the device without interruptions:

- Search for a 100% D.C. value in the technical data, which corresponds to the existing ambient temperature.
- 2 Reduce the power or amperage value correspondingly so that the device can operate without a cool-down phase.
